

Backlit fabric for UV print

Fabric is what's hot right now. If you own an EFI™ Wide Format or VUTEk® printer, there are many fantastic options for UV-printable fabrics. Especially, for backlits.

Backlit fabric and UV DO go together!

Silicone edge graphic (SEG) signs are a popular application for retail graphics. Retailers are making the switch to SEG lightboxes.

Why use fabric for backlit?

Fabric is great for larger lightbox installations since some fabrics are available in up to 3- and 5-metre rolls. The graphic is tensioned across the frame, so there is no sagging, wrinkling, or visible seams. This makes fabric a great option for airports, trade shows, and other markets in which large lightboxes are the norm.

All of EFI's backlit multi-layer techniques can be used on fabric to ensure your graphic is colourful and stunning. Want to print a day/night graphic? Done. Want to create a dual day/night graphic? No problem. Need to double-hit some reds and blacks for extra richness? We've got you covered!

Below are the backlit materials to get you started:

- Berger Textiles Samba
- Senfa Pearl (AKA Dynajet L110)
