

Fiery FS400 Pro and Fiery FS400 print servers

Product guide for cutsheet toner
printers and presses

This document represents the feature set typically included in Fiery® print servers. Actual feature set included may vary by specific Fiery models, as some features may not be supported due to specific project implementation characteristics or regional requirements. For information on a specific Fiery model's feature set, refer to that model's datasheet or ask your Fiery vendor. Nothing herein should be construed as a warranty in addition to the express warranty statements provided with EFI products and services.

Introduction

The changing market for digital front ends

In a U.S. survey, *Digital Front Ends: Understanding Market Dynamics and Customer Requirements*, InfoTrends identified the key features that respondents look for in a digital front end (DFE) for print engines:

Raster image processing (RIP)

- Converting content specified in a page description language into raster images that a printer can read and process

Job management / file handling

- Receive, manage, and prepare jobs for print production
- Select media and finishing options
- Release files into print production

Prepress and makeready capabilities

- Colour management
- Imposition, preflighting, and trapping

Automation support (job ticketing)

The report further found that the reputation of the vendor is an important consideration for end customers, as are the following:

Ease of use

Consistent and reliable output

High performance based on RIP speed

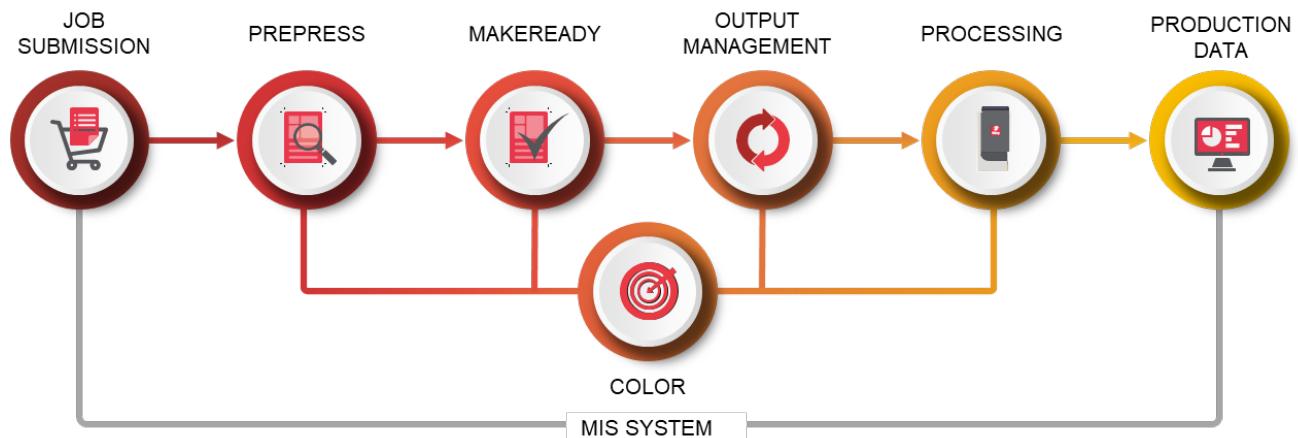

Familiarity of interface and operational consistency

Finally, the survey showed that most print service providers use digital front ends to perform a wide variety of prepress, makeready, and job management tasks, as well as to release jobs to print. InfoTrends also projects from the survey information that digital front ends will quickly become a key part of end-to-end, automated workflows and will integrate into cloud workflows. The survey report also notes, "As DFEs are becoming more tightly integrated, there is a need for wider job ticketing support, better integration with workflow or accounting solutions, and higher compatibility with traditional/offset workflows."

Fiery Workflow Suite

Fiery servers are a fundamental component of the Fiery Workflow Suite, a comprehensive set of integrated products that helps print facilities produce more from existing print engines with streamlined and automated workflows; quickly adapt to changing customer demands; and grow with new higher-profit, value-added services.

Fiery FS400 / FS400 Pro print servers – Product guide

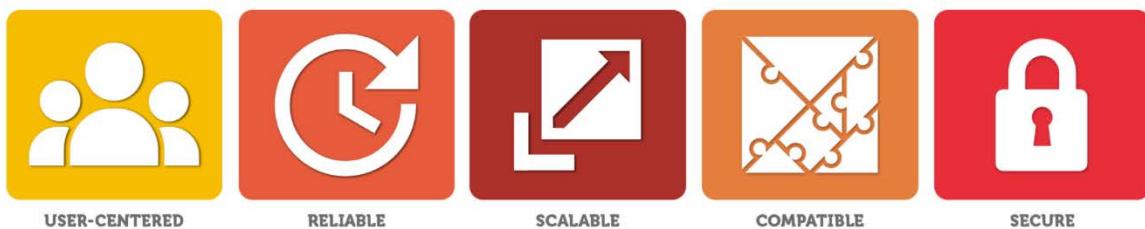

Fiery Workflow Suite is a comprehensive set of integrated products to accelerate business growth and profitability

For more information on Fiery Workflow Suite and to watch the overview video visit the efi.com/fieryworkflowsuite.

Fiery Foundation

Every Fiery digital front end that EFI designs, builds, and sells is based on a core set of foundational values. These values define our products, and are the promises we make to our customers each and every day. Our values drive us to provide Fiery products that are user-centered, reliable, scalable, compatible and secure.

User-centered

In case you think user-centered sounds like another technology buzzword, it's actually something we deliver. Building DFEs is what we do. But we build them by thinking about the actual people who use our DFEs. Our commitment is really to them. That's why we provide an integrated set of experiences at every stage. The interface is intuitive, quick, and responsive — which makes our products easy to learn and use. And we make our servers quick to set up, back up, and maintain. This ease of use minimizes mistakes and reduces steps to get a job done — so our customers can spend more time on what they're paid to do.

We also built EFI Communities that connect nearly 15 thousand Fiery users to each other and to our experts, so our users can find the best ways to get things done. It's an incredible way to share knowledge and expertise worldwide.

Fiery FS400 / FS400 Pro print servers – Product guide

Reliable

Fiery users expect our equipment to run all the time, and to keep up with their printers. From factories that print millions of dollars of corrugated material to graphic artists who have to get a design in front of a customer in minutes, people depend on us. And we deliver. Made for the needs of 24-by-7 production, Fiery products work all the time, every time, even for the most demanding applications. Fiery servers are also resilient and easy to update with the latest fixes to keep systems running their best.

Scalable

What does scalable actually mean? It means Fiery servers can grow with businesses. If a customer is a start-up with a 50-page-per-minute printer, we have an embedded server that will add a lot to what they can do. If they want to add another printer, we have a DFE that will work for that expanded environment. We have workflow and colour management software for more advanced work, and for automation. We have Fiery servers that let customers expand to wide format. And they all have the same job management interface. So, operators don't have to learn a new interface for every print engine, and shops don't have to redesign their whole workflow to add Fiery products. As part of our brand promise, all this flexibility comes with the best price/performance in the industry. Our customers can add functionality as their business grows or needs change, just by adding software packages or subscriptions. They can even upgrade their print workflow with the latest innovations and features to improve productivity with Fiery Command WorkStation® updates. Taken together, we're talking about a lot more than a wide range of servers. We're talking about adding innovation over the life of the print system.

Compatible

In the old days, buyers might get stuck with new equipment that didn't work with what they already had and kept them from modernizing.

So, we build Fiery servers to operate in an open, multi-brand environment to avoid workflow silos, and to give customers the highest level of operational flexibility. Our DFEs support Fiery partner workflows, plus leading third-party prepress and cost-accounting products. On day 1, we have new drivers available for Mac or Windows updates so our customers can just keep printing. We're relentless about keeping Fiery technology up to date with the latest industry standards, including VDP languages, colour, and file formats — so users can accept and process all types of jobs.

Finally, Fiery API and JDF allow users to connect to EFI MIS and web-to-print systems, or to integrate to existing shop systems — all of which makes Fiery servers the most versatile and flexible in the industry.

Secure

Today, security needs change at a dizzying speed. We keep users up to date with the latest security requirements and standards. But we also stay on top of bug fixes and security patches, so our customers always know they can protect sensitive data and documents in any operating environment.

Fiery areas of leadership

We view our foundational values like the foundation that builders use to construct a solid, well-built house. These foundations have been in every Fiery server we've made for more than 25 years. On them, we constantly innovate with features and functions in the areas our customers care most about — producing high-quality, accurate output, quickly and efficiently. We call these areas: colour and imaging, productivity, management, and connection.

COLOR & IMAGING

PRODUCTIVITY

MANAGEMENT

CONNECTION

Fiery FS400 / FS400 Pro print servers – Product guide

Colour & Imaging

Fiery systems deliver the best imaging technology, with accurate and consistent colour

Fiery servers provide state-of-the-art imaging technology, combined with expert colour management tools, to deliver high-quality images with the accurate, consistent colour customers want. Print providers can print the colour the designer intended, looking just the way they wanted. And provide accurate and consistent colour every time, all the time; and outstanding, high-quality images that satisfy the most demanding print buyers.

Productivity

Fiery systems provide performance and automated workflows that maximize printer throughput

To succeed in today's competitive environment, print providers need to offer customers more services, while increasing operational efficiency for higher profitability. To achieve both requires the processing power and capability of the Fiery digital front end. To provide this, we also include features that directly improve turnaround times by automating workflows to keep print engines running at rated speeds, even for the short-run jobs that more and more print providers have to handle.

Management

Fiery systems enable profitable production of high-value products through leading job preparation and management

Unfortunately, increased functionality can lead to complexity. To make sure that doesn't impact productivity and costs, EFI innovations in the "management" area give users tools that speed job preparation and provide better device management — to not only produce high-quality printed materials quickly, but more bottom-line profit too.

Connection

Fiery systems offer the versatility to fit in any environment with reliable system operation

Connection means the ability to fit in. Fiery DFEs have to work with everything from workflow software to an MIS system. And they do. Advanced connectivity technology provides easy, scalable Fiery integration to, and compatibility with, business and other production systems to increase efficiency; and provide secure, reliable operation in a variety of different environments.

Range of Fiery DFEs

In addition, a wide range of Fiery server families gives print service providers all the choices they need to meet their particular business demands with features for production processes, from web submission to management, prep to production:

Fiery NX Premium — an exceptionally high-performance system for high-level production and mission-critical users with high-speed engines

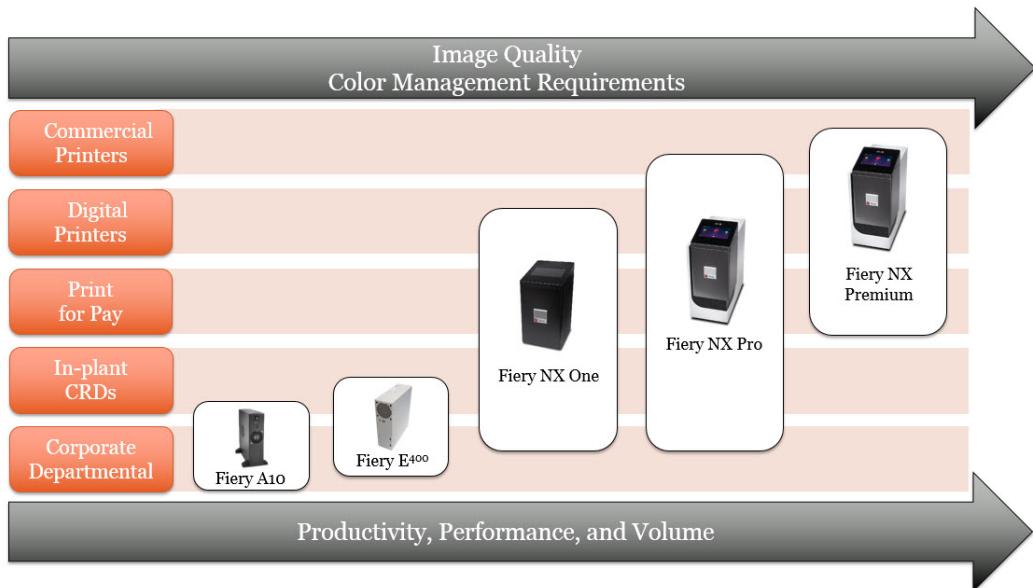

Fiery NX Pro — a high-performance system for users who require quality and advanced makeready capabilities

Fiery NX One —seamless workflow management and superior image quality for both colour and black-and-white production printing environments with tight deadlines and high customer expectations

Fiery E⁴⁰⁰— the ultimate document-publishing system that takes the pain out of producing complex colour documents, providing efficiency and ease of use for small/medium businesses and enterprise office users alike

Fiery A10 — a low-cost Fiery server for office users that require performance for large volumes of jobs; accurate brand colours; and simple, visual ways to prepare jobs for printing

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery server families suit any digital print need and environment. Check the Fiery datasheet, or contact your Fiery dealer for the standard and optional features for a specific Fiery server model.

Fiery industrial design

Fiery NX design

FS400 Pro servers feature the cutting-edge and innovative Fiery NX industrial design that was precisely crafted with the Fiery user in mind.

Fiery QuickTouch

The new Fiery NX server design includes the Fiery QuickTouch software on the touchscreen display, which gives faster views of job status information and access to server management. With just a tap, the touchscreen display gives users easy access to intuitive system installation, backup and restore functions, plus system diagnostics. The display rotates 90 degrees to provide operational flexibility and visibility. Three USB ports are conveniently located on the side of the display.

This new QuickTouch software interface is an extensible platform as users can add features and functions in new versions of Fiery NX servers over time.

For more information visit [this web page](#).

Benefits:

Faster views of job status and device management

Rotating touchscreen panel for better visibility

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery NX Station

The new Fiery NX Stations provide a centralized workstation for high user productivity. Either the Fiery NX Premium or NX Pro server can be placed inside the Fiery NX Station to provide a compact, centralized work station that adapts to different print production environments. A compact design reduces the footprint by over 20%, while the 31.5 x 18 inch table offers a large work area to perform activities such as calibration and profiling. A top tray stores commonly used items within easy reach, such as the ES-2000 spectrophotometer, and a rear compartment keeps the ES-2000 measurement ruler and backing board or key documents nearby. The wireless mouse and keyboard save space and make the work area more flexible. Five USB ports are easy to reach, with three on the side of the display, and two conveniently located by the work surface. The NX Premium/Pro server glides out on a sliding shelf for easy installation and service access. When the display is not in use, Fiery Ticker shows at-a-glance printing status and alerts to users at a distance.

The Fiery NX Station comes in two versions:

NX Station GL – The basic configuration with a 22" display

NX Station LS – Adds an adjustable-height workspace, a larger 27" monitor, a proximity sensor that wakes up the Fiery server as soon as it identifies someone approaching, and tidy power cable storage

For more information visit [the Fiery NX Station web page](#).

Benefits:

Efficient and ergonomic operation with new NX Station

Compact design reduces footprint by over 20%

Quick and easy to install and maintain

Fiery FS400 / FS400 Pro print servers – Product guide

Introduction to Fiery FS400/FS400 Pro

Fiery servers are constantly evolving to offer the best choice for every print engine and Fiery server combination on the market in terms of productivity, ease of use, colour quality, and integration. Fiery system software platforms have version names to show their evolution over time. The following list of Fiery system software versions is ordered from older to newer since 2006:

For external Fiery servers	For embedded Fiery servers
Fiery System 8	Fiery System 8e
Fiery System 9	Fiery System 9e
Fiery System 9 R2	Fiery System 9e R2
Fiery System 10	Fiery System 10e
Fiery FS100 Pro	Fiery FS100
Fiery FS150 Pro	Fiery FS150
Fiery FS200 Pro	Fiery FS200
Fiery FS300 Pro	Fiery FS300
Fiery FS350 Pro	Fiery FS350
Fiery FS400 Pro	Fiery FS400

The Fiery FS400/FS400 Pro system is the most innovative, scalable, and integrated server solution for print engines, ensuring that customers obtain the highest return on their investment.

Fiery FS400 is available for embedded Fiery servers, and Fiery FS400 Pro for external Fiery servers.

Target markets

Production environments include: commercial printers, digital printers, quick printers, print-for-pay shops, in-plant commercial reprographics departments (CRDs), and marketing service providers.

Target print applications

Marketing materials: brochures, catalogs, stationery, direct mail, cards, tickets, and coupons

Photo publishing: photo books, postcards, and calendars

Corporate: newsletters, presentations, proposals, business cards, and forms

Book publishing: books and manuals

Packaging: boxes, envelopes, and proofs

Variable data printing (VDP): direct mail, catalogs, and transactional promotional material

Fiery FS400 / FS400 Pro print servers – Product guide

FS400 Pro and FS400 new features table

This product guide defines Fiery servers that include new features in Fiery FS400 Pro and FS400 system software with Fiery Command WorkStation Package 6.5. These new features provide substantial gains in productivity, deliver accurate and amazing colour, include impressive improvements in ease of use, and enhanced integration – helping print providers reduce costs and improve service.

Fiery FS400 / FS400 Pro print servers – Product guide

Performance technology

Fiery servers are the fastest RIPs in the industry. The Fiery DFEs are powered by proprietary EFI application-specific integrated circuits (ASICs) with RIPChip™ technology that enables them to take full advantage of custom-designed microprocessors, proprietary file-compression algorithms, and efficient memory management to produce industry-leading performance.

As a result of unparalleled processing speeds, shops can get more data to print engines faster so that the engines are less likely to move into cycle-down and warm-up modes — losing valuable press time. A fast DFE also helps meet tight turnaround times and reduce bottlenecks. The following features define the Fiery performance technology that allows users to grow their businesses with more-profitable, timely, top-quality work — including higher-value, fully personalized jobs.

Fiery NX hardware

The new, breakthrough Fiery NX servers have a cutting-edge and innovative industrial design, customized for Fiery users and for the needs of a highly efficient print environment.

There are three types of Fiery NX servers:

Fiery NX Premium

High-volume, powerful servers for commercial printers, in-plant shops, and digital printers

Fiery NX Pro

Mid -volume servers for digital printers, print for pay, and in-plant shops

Fiery NX One

Mid -volume servers for black and white or lower-speed colour digital printers targeted to print for pay, and in-plant shops

Fiery NX Premium, NX Pro and NX One servers

Fiery HyperRIP

Fiery HyperRIP is a proprietary EFI rendering technology, available on Fiery NX Premium hardware platforms, that makes performance-leading Fiery servers even faster. HyperRIP dramatically improves performance by simultaneously processing print jobs up to 55% faster by optimizing the use of the Fiery server's interpreter and rendering engines across multiple processor cores.

As files become more graphically complex and more jobs require personalisation, a higher RIP capability helps optimize the print engine capacity and gets the most from the investment. Instead of adding hardware cost with more CPUs, Fiery HyperRIP software technology provides a more economical solution to print shop owners.

Watch the Fiery HyperRIP video at fiery.efi.com/hyperripvideo for a short overview of the feature.

Fiery HyperRIP offers two modes of parallel job processing:

1- Single job

The single-job mode simultaneously RIPs a job across up to four processors and is useful for longer jobs of 20+ pages.

Single-job mode is ideal when printing long, multiple-page and VDP jobs, because HyperRIP processes those jobs faster to make the Fiery server available to handle upcoming jobs.

HyperRIP Mode

Multiple jobs (best for short jobs)

Choose this setting to process the maximum number of jobs simultaneously. This mode is optimized towards printing many small jobs in the fastest possible time.

Single job (best for longer jobs)

Choose this setting to process individual jobs as fast as possible, by processing multiple pages of the same job in parallel. If the server is primarily printing long jobs or RIPping jobs one at a time, this mode provides the best performance.

HyperRIP modes are server settings found in the Fiery Configure module under the RIP selection. The single-job mode is selected by default.

Fiery FS400 / FS400 Pro print servers – Product guide

The processing bar in Command WorkStation Job Center is split, showing four progress bars side by side — updating simultaneously and independently to track the HyperRIP progress.

File formats supported by HyperRIP in single-job mode

Fiery FS400 Pro supports many more file formats for HyperRIP in single-job mode than FS200 Pro systems. This table lists the file formats supported, and the limitations with some workflows and print settings. If the Fiery server determines a file is not eligible for HyperRIP, it will automatically route the job through the single RIP path.

File type	Plain	Duplex	XObjects / Form caching	Mixed media	Control bar	Print range Page/record	Imposition	Post-flight	Direct queue

PCL	No	No	No	No	No	No	No	No	No

HyperRIP support for record range

This feature expands the uses of HyperRIP by enabling its use in single-job mode when printing a range of records in a VDP job. This provides faster processing to both CPSI and APPE processing paths.

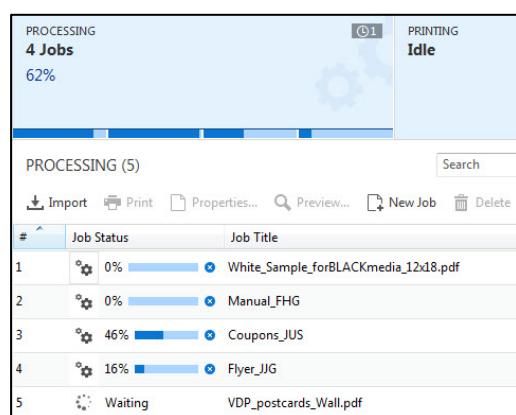

2- Multiple jobs

The multiple-jobs mode simultaneously RIPs several jobs across up to four processors, and is ideal when dealing with numerous short jobs such as book covers, brochures, or flyers — or when a long job is being processed while other shorter jobs need to start printing.

Jobs processed in this mode will print in the order they finished RIPping, meaning that smaller or shorter jobs will print before longer or bigger ones. If maintaining the print job order is important, this mode is compatible with the Sequential Print feature which requires that jobs output in the same order they were submitted to the print queue. Sequential Print is a server setting that is enabled in the Fiery Configure module.

Some file formats are not supported by the multiple jobs mode and will be processed using a single RIP path. Those are: PPML, VDP, VIPP, PCL, and FreeForm.

After a HyperRIP job has finished printing, the job log and printed queue have the following optional attribute columns:

A job split by HyperRIP to RIP on four processors.

Fiery FS400 / FS400 Pro print servers – Product guide

Number of RIPs present: indicates the total number of RIP processors available to the job during processing.

Number of RIPs used: indicates the actual number of processors used to RIP the job. Not all jobs can use HyperRIP, and some will use a single RIP processor instead.

Benefits:

Dramatic performance improvements by processing multiple jobs or multiple segments of the job simultaneously

Faster throughput means less waiting for users

Rush RIP

Rush RIP is a unique Fiery feature that works in combination with the Fiery HyperRIP multiple-jobs mode. It is only available for Fiery NX Premium servers.

Rush RIP offers the ability to immediately RIP a single job without interrupting other currently RIPping jobs. This happens when the first four Fiery RIP processors are busy RIPping jobs. The Fiery server makes a fifth processor available immediately upon request to process the rush job at the same time other jobs are RIPping. If yet another job is sent to RIP as a Rush RIP job, and all five RIP processors are busy, the job will be processed as soon as any of the five RIP processors are available.

Users activate Rush Print when selecting the following actions from the right-click menu on Held Jobs:

Rush Print — When selecting Rush Print, the rushed job is sent to the top of the "waiting to RIP" queue. Once a Rush Print job finishes RIPping, it will interrupt a currently printing job and start printing.

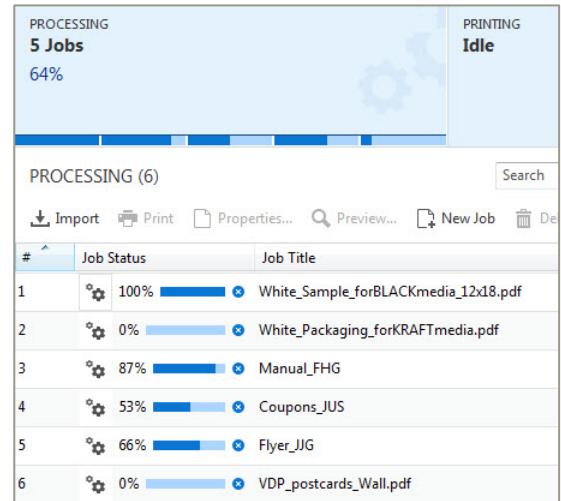

Rush Process and Hold — When selecting "Rush Process and Hold," the job goes back to the Held queue as a processed job.

Benefits:

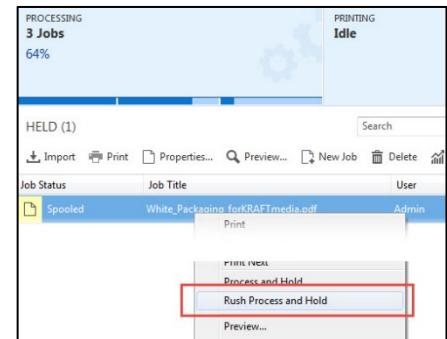

Rush RIP is a great print management tool for high-end production environments and gives users even more control at the print queue by:

Starting to process an urgent job without cancelling jobs currently being processed, or having to wait for those jobs to finish processing

Being able to preview jobs quickly while other jobs are processing

The Fiery server makes a fifth RIP available immediately upon request to process the rush job

Rush Process and Hold

Spool-RIP-Print Simultaneously

Over the years, Fiery servers have incorporated various innovative technology features to improve throughput. Designed to enhance the Fiery system's overall performance, these features are now unified as the Spool-RIP-Print Simultaneously feature. Users can now spool, RIP, and print a single multiple-page job, or multiple jobs simultaneously, for these benefits:

RIPChip technology: Proprietary EFI application-specific integrated circuits (ASICs) enable Fiery servers to take full advantage of custom-designed microprocessors, proprietary file compression algorithms, and efficient memory management to produce industry-leading performance.

ECT Compression: Compression software provides flexible compression ratios and visually lossless image quality. Decreases the amount of memory necessary to store documents during processing, and enables faster printing of documents.

RIP-While-Print: Print one page while subsequent pages are simultaneously processed.

Fiery FS400 / FS400 Pro print servers – Product guide

Continuous Print: Store processed pages in memory before printing, eliminating the need for the copier or printer to cycle down between unique pages.

RIP-1-While-Print-2: Work simultaneously on two jobs for the RIPping and printing processes. Starts to RIP a new file while the previous file is printing.

RIP-While-Receive: RIP a job while it is still being spooled to the Fiery server for a much faster first and last page out. There is no need to wait for the entire job to spool before beginning to RIP the file.

Benefits:

- Increases the Fiery server throughput by delivering faster output to the print device
- Increases productivity by making the Fiery server more available to process jobs
- Reduces bottlenecks at the RIPping stage
- Helps maximize print device's capacity and shop productivity

Fiery SmartRIP

Fiery SmartRIP technology uses a combination of proprietary hardware and software that processes files faster and handles higher resolutions with ease for all Fiery configurations. SmartRIP helps accelerate colour, compression, and rendering processes by recognizing file characteristics and using adaptive processing.

Users will especially notice the benefits of SmartRIP technology when:

- The combination of an Adobe Configurable PostScript Interpreter (CPSI) RIP with Fiery SmartRIP technology yields dramatically faster page processing by recognizing file characteristics and using adaptive techniques to accelerate colour, compression, and rendering processes
- The improvements in overall throughput optimize the print time for merging VDP jobs
- The efficient use of memory and hard drive space improves efficiency and predictability to support VDP
- The enhanced image processing allows users to print composite overprints of CMYK and Fiery Spot-On™ colours – this key feature enables Fiery servers to pass the Altona Test and Ghent suites.

Benefits:

- Achieves RIP performance benchmarked at up to two times faster in a dual processor, and one-and-a-half times faster in a single processor
- Improves efficiency and predictability in colour and VDP
- Produces visibly smoother edges and fine type at high resolution (1200 dpi and up). This is quite noticeable in Kanji fonts as well as in Roman faces with delicate, thin elements

Auto-detect Composite Overprint

One way to ensure that all jobs print with the correct overprinting and transparency effects, is to enable Composite Overprint in Job Properties for all jobs going to print. With this selected, all pages are processed for overprinting and all jobs print correctly.

But jobs that do not require this extra treatment will process faster without going through the Composite Overprint step. A unique Fiery feature called Auto-detect Composite Overprint bypasses this step and processes the job at the highest speed.

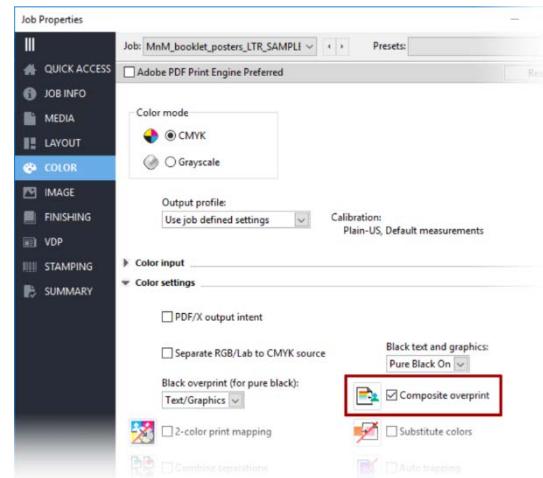

Auto-detect Composite Overprint automatically detects whether or not a job needs composite overprinting and processes only those jobs that contain overprints with the extra processing.

Documents that are RGB-only PDFs, commonly used in the photobook industry, and CMYK documents that don't contain overprints, can gain up to 15% in processing performance.

This performance improvement is guaranteed in Fiery external servers, since Composite Overprint is enabled as a default setting. For Fiery embedded servers, the Composite Overprint setting is available and turned off by default.

Benefits:

Jobs will process as fast as possible, while ensuring the overprinting and transparencies are rendered correctly every time

Composite Overprint setting in Job Properties

Optimized PDF

PDF Xobjects are a way of describing objects such as text, images, and vectors within a PDF file. They are automatically generated by the application. Xobjects store common information such as background, headers, and footers that can be drawn multiple times in a PDF document. Their content is stored only once in the PDF file to allow for greater efficiency.

When Optimized PDF is enabled on the Fiery system, Xobjects are processed just once for the entire job. RIPped versions of these elements are cached to be used any time the Xobject is needed in a page — allowing the Fiery system to reduce processing time.

PDF Xobjects on a per-job basis

Users can use Xobjects and optimize a PDF job on a job-by-job basis. Just select the feature in Command WorkStation through Job Properties as Cache PDF and PostScript objects under the VDP tab, or use Fiery Hot Folders from a client system.

Benefits:

Increases throughput by reducing the need to re-RIP the same image in the same file

Improves the PDF workflow by successfully rendering PDF files containing Xobjects

Job submission automation

It is critical to automate complex tasks and leverage all available resources in a production environment that regularly receives jobs from external sources. In-plant and CRD operations, as well as commercial organisations, use digital workflows to capture as much formatting and direction from users as possible. This helps to shorten job-preparations times, minimize errors, and speed up turnaround times.

Fiery servers offers a wide range of tools to streamline workflows from submission to output and therefore, adapt to any type of automation needs.

Job Presets

Job Presets allow the user to save predefined print settings as a retrievable template from a Fiery driver or from Job Properties. Users can create several templates to define settings based on their own common printing scenarios, and to streamline job submission with fewer clicks and errors.

Server Job Presets

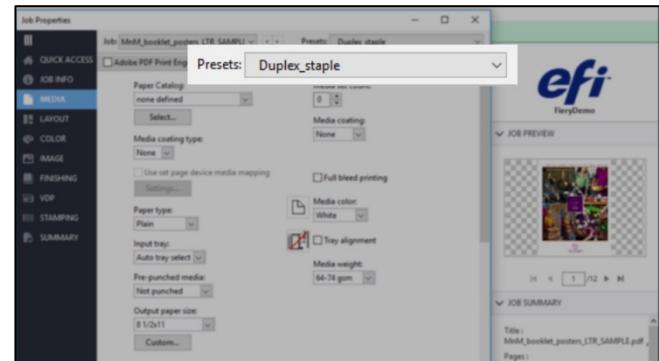

Local Job Presets are available only on the user's client workstation. Administrators can create Server Job Presets to share Job Presets with all Fiery users. This way, they can automate the selection of Job Properties for commonly used tasks, saving time and maximizing productivity.

Administrators can save, edit, publish, and delete Server Presets from the Command WorkStation Device Center. They can also create Server Presets from Job Properties in the Command WorkStation, right after selecting the applicable job settings, by simply providing a name and description. Other users can access these centrally stored presets through workflows such as Virtual Printers, Fiery Hot Folders, Job Properties, print drivers, and Fiery JobFlow.

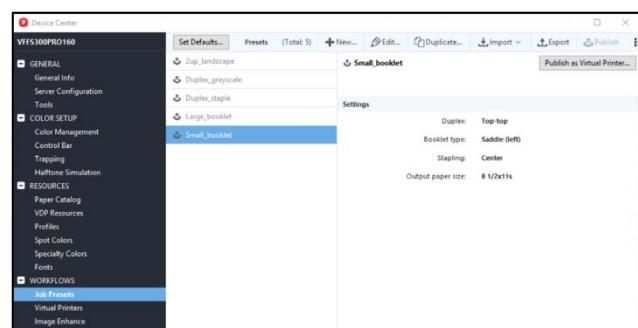

Benefits:

Allows all users to access commonly used settings in all workflows

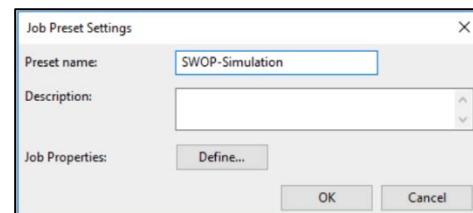

Permits administrators to save and manage the most used settings, and then easily publish them as Virtual Printers and Fiery Hot Folders

Job Presets in Fiery driver

Save, edit, publish, and delete Server Presets from the Command WorkStation Device Center.

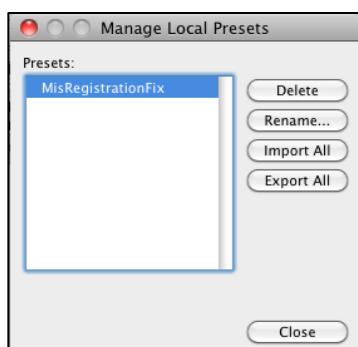

It's easy to create server Job Presets by providing a name and description for the job settings.

Fiery FS400 / FS400 Pro print servers – Product guide

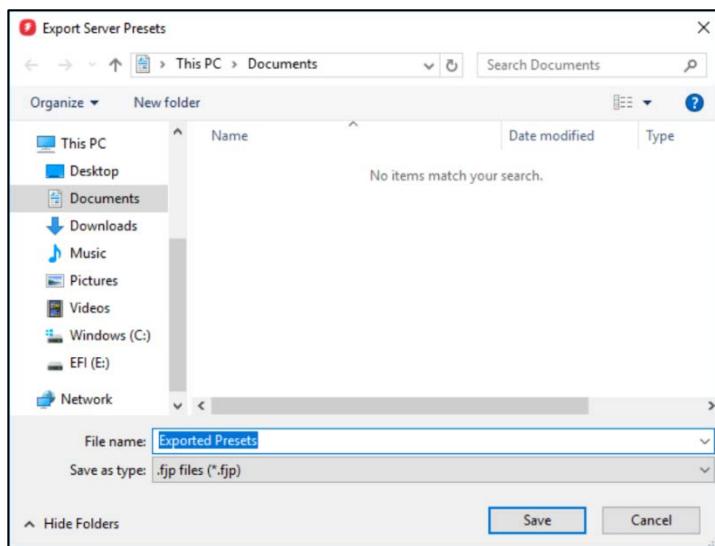

Import and export Job Presets

This feature offers the ability to import and export both server and local Job Presets. Local Job Presets can be exported and shared between users. Only administrators can manage Server Presets.

Users can export and import Server Job Presets.

Users can export and import Server Job Presets between Fiery servers of the same model, streamlining the process of programming multiple servers to behave identically.

Export Server Job Presets.

Benefits:

Share and back up local Job Presets for safekeeping

Easily and quickly make Server Job Presets available to multiple Fiery users

Create automated workflows for any repetitive task, reducing the number of times a job needs to be touched during printing

Fiery FS400 / FS400 Pro print servers – Product guide

Product-specific presets

Fiery servers include five Server Presets to help users quickly set up jobs with some frequently used print settings, including both layout and finishing options. This also promotes the use of server presets and workflows.

The server presets include:

US and metric presets

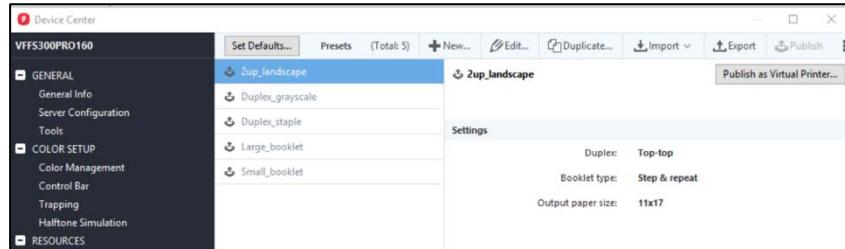

2up landscape

Duplex grayscale

Duplex staple

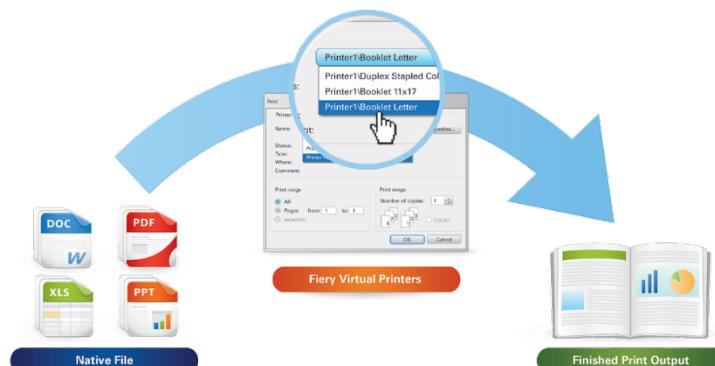

Large booklet

Small booklet

Fiery Virtual Printers

Fiery Virtual Printers lets production print administrators create a specific configuration for a certain print device that contains all the print driver settings they need for a given job type. They can then present the configuration to users as a printer with a specific name. For example, a user who prints training manuals on a regular basis could simply print to a printer named "Training Manual," greatly reducing interaction between user and production while capturing pertinent data for the job.

In comparison with Fiery Hot Folders, Virtual Printers are managed and configured centrally by a Fiery administrator. All settings are controlled at the Command WorkStation, where only an administrator can view and/or change the published Virtual Printers and details associated with them. Virtual Printers are also designed to be used directly from a print driver.

Virtual Printers come standard with external servers, and are an optional feature for some embedded servers.

The administrator has rights to the following functions:

- Create new virtual printers
- View the available virtual printers (and published queues)
- Publish, delete, or edit virtual printers

Key functions and features of Virtual Printers include:

- Defines a combination of up to 252 Virtual Printers on a Fiery server
- Is easily accessible from any print driver — ideal for driver-based workflows
- Provides Fiery system actions such as hold, process and hold, print, and print and hold
- Comes with imposition and override settings

Benefits:

- Automates workflow for all users, increasing productivity
- Reduces repetitive workflows for faster, error-free printing
- Ensures that print processes and company standards are maintained; relevant settings can be preserved as admin-lockable

Fiery Hot Folders

Fiery Hot Folders let users do more work by automating the job-submission process with a simple drag-and-drop operation. Fiery users can publish and share Fiery Hot Folders with other users in their network for faster, error-free printing for everyone. Users can copy or simply drop documents into hot folders which will then send them to a Fiery server with the pre-set print settings. Hot folders can be set up to specify certain job properties, to impose jobs, and to merge jobs.

Fiery Hot Folders relieve the user of the repetitive task of configuring print settings for multiple jobs, and allow direct printing of files without the need to open them in their native application such as Adobe Photoshop® or Microsoft Word. Since hot folders appear as folders on a host computer and can be shared on networks, they provide a simple way to forward jobs without installing special utility software on each computer.

Fiery Graphic Arts Package, Premium Edition includes a set of expert-level filters designed for Fiery Hot Folders. These filters allow users to submit jobs in their native file formats without opening the native application. This way, jobs can be routed to the Fiery server with predetermined settings attached — including PPD overrides, imposition attributes, and file format conversions.

Fiery Hot Folders come standard with external servers, and are an optional feature for some embedded servers.

Benefits:

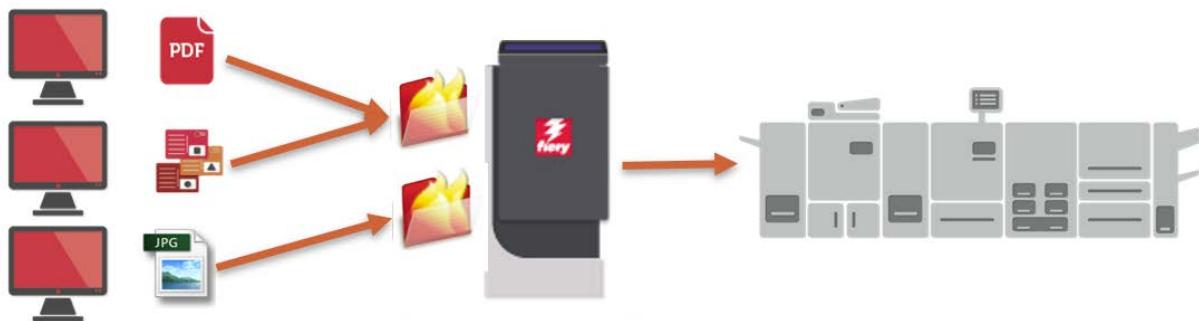

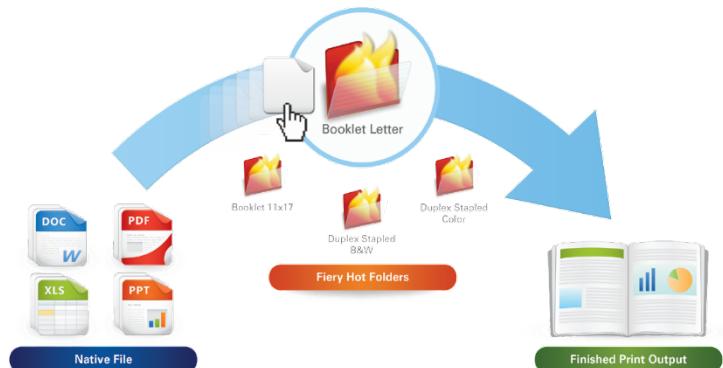

Automates workflow for all users, increasing productivity

Reduces repetitive workflows for faster, error-free printing

Fiery Hot Folders runs as a service

The Fiery Command WorkStation Package includes Fiery Hot Folders version 4. This version runs the Fiery Hot Folders application as a service, either when installed on a client or on the Fiery server. This allows shared hot folders to continue to work, even when the host computer is logged out

Previously, if the host computer for Fiery Hot Folders was restarted, hot folders would not process files until a user logged on to the computer. With version 4, Fiery Hot Folders will continue to process without any manual intervention.

Clients submit jobs using shared Fiery Hot Folders. Fiery server runs Fiery Hot Folders and shares them over the network.

Fiery FS400 / FS400 Pro print servers – Product guide

Microsoft Office filters

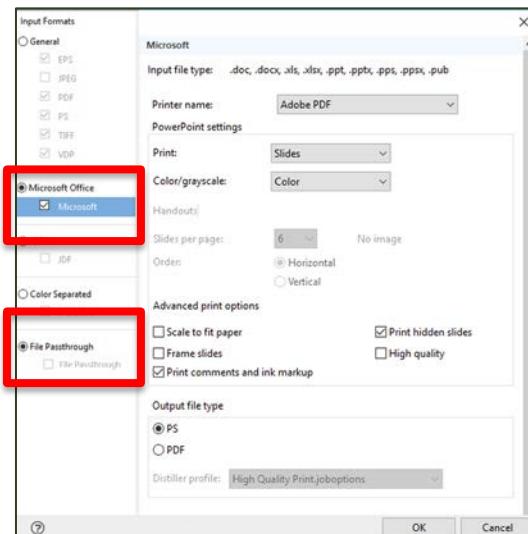

The only exception to the hot folder operation described above is with files that require Microsoft Office filters. These files use the Microsoft Office applications on the host computer to process in the background, and so require a user to be logged in, and to launch the Fiery Hot Folders application. Microsoft Office files dropped into a hot folder will wait until the user logs in, and then will resume processing automatically.

For this reason, the Fiery Hot Folder interface for Input Formats shows Microsoft Office filters as an exclusive format. Users need to create a specific hot folder to receive Microsoft Office files.

File Passthrough

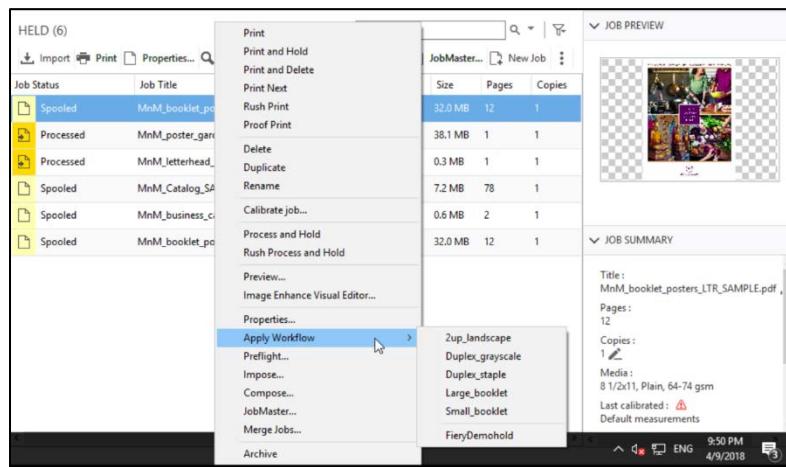

This new input format enables the use of hot folders to submit jobs supported by the Fiery DFE, but not covered by all supported filter formats. In this scenario, job formats such as PCL or non-standard PDF files can be imported to the Fiery server instead of using the Fiery driver.

This submission method allows files to be passed through to the Fiery server without checking the file format or validating headers, and Job Properties will not be applied. In other words, the result would be the same as if the user had imported the file using the File/Import action in Command WorkStation.

Fiery Command WorkStation

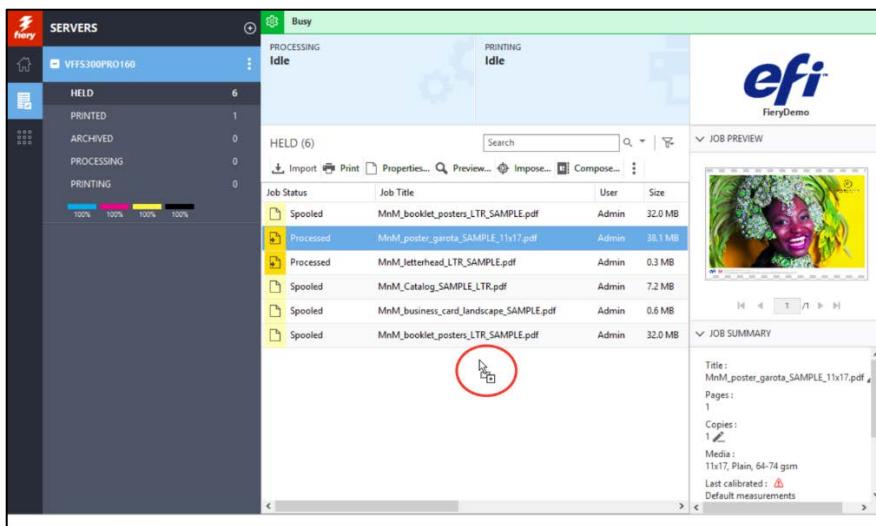

The Fiery Command WorkStation interface offers a way to automate job-submission workflows by quickly selecting Server Presets after right-clicking on a job. Fiery administrators can create and publish job-submission workflows as easily as they can create a new Virtual Printer, and can publish the workflows to make them available to everyone using that Fiery server. The automated workflows require a Fiery server with Virtual Printers or Server Presets.

Make a Server Preset selection with a right-click on a job.

The Drop Zones feature gives a new look and feel to Fiery Command WorkStation by clearly indicating the areas where users can drop files for printing. It also displays an easy way to associate Server Presets and Virtual Printers after dropping files in the server list pane.

Fiery FS400 / FS400 Pro print servers – Product guide

Drop zone indicated on the Held queue

Benefits:

Easy way to associate Server Presets and Virtual Printers while downloading a job onto the Fiery server

Fiery JobExpert

Fiery JobExpert is a breakthrough new technology that analyzes incoming PDF files and dynamically chooses the optimal print settings to achieve the highest quality, while optimizing production time.

To accomplish this, Fiery JobExpert will:

Analyze each PDF print job in detail

Automatically set the optimal Fiery Job Settings

Process each job to efficiently achieve the best possible print quality

Report and highlight each suggested change

Fiery JobExpert serves as built-in expert that delivers:

Highest print quality — Fiery JobExpert always chooses the processing path for the highest possible output quality.

Faster processing — Some files don't require turning on advanced imaging settings that can slow down processing. Fiery JobExpert defines the settings necessary for that specific job, ensuring it uses the fastest processing path.

Enables less-experienced operators to run jobs correctly — It automatically enables settings the operator might not even have considered or known about.

Reduces setup time — Fiery JobExpert detects print requirements quickly, including those that cannot be detected by an operator.

Cuts waste — There's no need for trial and error prints on complex jobs or for interrupting production to print a proof copy. Instead, consistent analysis-based processing gets it right the first time and every time.

Undo if needed — Operators may overrule Fiery JobExpert at any time.

Accessible report — After defining a job's settings, Fiery JobExpert generates a report for each suggested change. It provides a highlighted view of the changes made to a job

Fiery JobExpert is enabled when importing a job in Command Workstation, Fiery Hot Folders or Virtual Printers. Check the how-to guide to learn the best way to use Fiery JobExpert.

For more information visit [the product web page](#).

Fiery Impose – Integration from prepress to post press

Fiery Impose has been introducing significant improvements to the integration between Fiery Impose and the most popular offline finisher equipment manufacturers. Users can automate the job preparation process all the way from prepress to post press, to guarantee the final products are produced efficiently and with minimal waste.

Read the full description in the [Fiery Impose section](#).

Fiery JobFlow

Fiery JobFlow offers automated prepress processes that are easy to set up and use, to minimize rework and boost overall efficiency on the print floor.

The Fiery JobFlow installer is included in the list of applications to download from the Fiery Software Manager on Windows workstations. Users can access the browser-based Fiery JobFlow application from Mac or Windows client workstations. For external Fiery servers running on FS200 Pro and later, Fiery JobFlow Base comes pre-installed on the server itself.

Installing the Fiery JobFlow application gives users access to the free version, Fiery JobFlow Base. Users need a paid license upgrade to unlock the full functionality of Fiery JobFlow.

Fiery JobFlow Base is used to configure automated workflows for:

Submission from multiple locations (Dropbox, shared folders, and FTP), or by a drag-and-drop operation directly to the workflow

PDF conversion

Job merging and reorganizing pages

Batch and collecting jobs

Fiery Preflight (requires Fiery Graphic Arts Package, Premium Edition or Fiery Graphic Arts Pro Package)

Image enhancement

Document imposition (requires Fiery Impose)

Job ticketing

Receiving email notifications

Archiving and output to multiple locations (Dropbox, shared folders, FTP, and Fiery external servers)

The full version of Fiery JobFlow contains additional features:

Rules-based workflows

Image scaling

Advanced preflight (powered by Enfocus PitStop)

PDF correction (powered by Enfocus PitStop)

Reviewers can approve jobs remotely

Automatically send jobs to next available printer

Cloud-based approval workflows

For more information on Fiery JobFlow, visit the product webpage at efi.com/fieryjobflow.

Benefits:

Eliminates repetitive manual setup and produces ready-to-print files with the fewest touchpoints

Detects and uses existing Fiery resources such as presets and templates, to avoid rework and to speed up the print process

Ensures consistency and higher efficiency when processing similar print jobs through the same workflow

Fiery FS400 / FS400 Pro print servers – Product guide

Allows internal and external reviewers to quickly and easily approve jobs remotely without interrupting the workflow

EFI MarketDirect StoreFront

EFI MarketDirect StoreFront is the award-winning, flexible eCommerce solution that offers an industry-leading experience for print buyers, and is designed to grow your business.

The Fiery integration setup wizard helps establish a touchless workflow with EFI MarketDirect StoreFront to save time and eliminate errors — synchronizing media libraries; job status; and job configurations such as colour settings, layout, and finishing.

For more information refer to the [Integration section](#) in this product guide.

Variable data printing

No matter what you call it — personalisation, customisation, versioning, transactional printing, variable information (VI), or simply variable data printing (VDP) — market research proves that personalized communications or targeted marketing can significantly improve a company's bottom line. Overall revenues and profits associated with personalized marketing programs are more than 31% greater than those from general marketing. Personalized communications also garner measurable increases in the size and value of orders. Customers are apt to respond more quickly and in greater numbers to personalized marketing messages. And personalized communications increase customer loyalty and retention by more than 47%.

Today's overall trend toward targeted marketing will only intensify in the future. For organisations with the right resources, marketing support, and business knowledge, VDP is more than just a powerful tool: it's a strategic necessity. But currently, there are no simple, off-the-shelf VDP solutions. Instead, VDP requires customized end-to-end attention to customer needs and budgetary constraints.

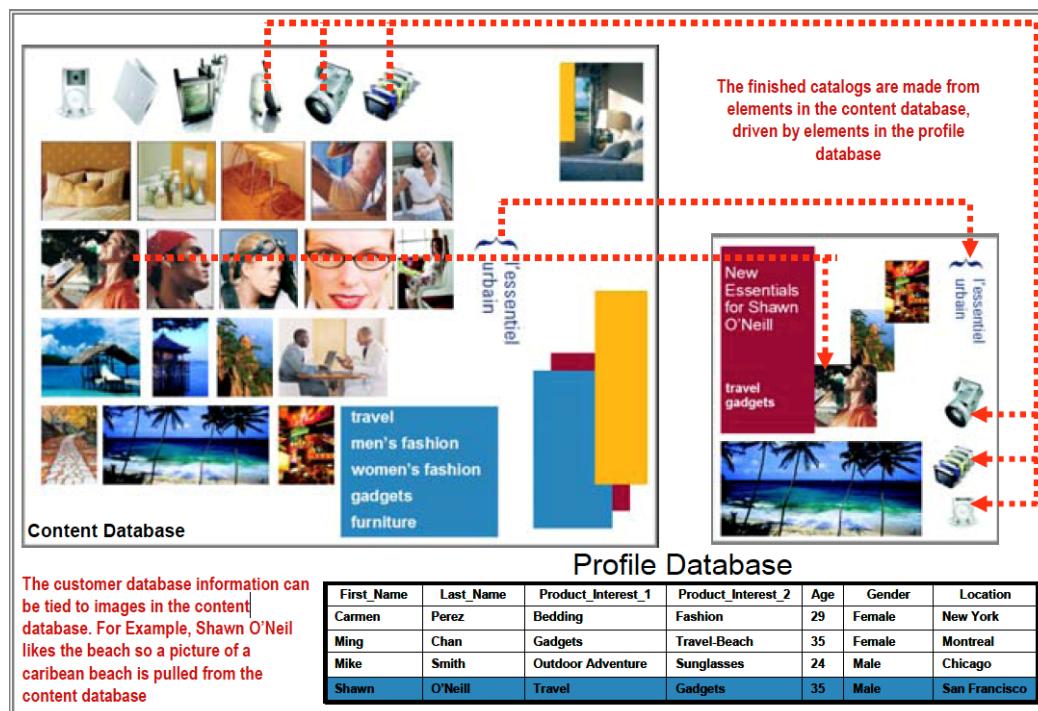

EFI Fiery VDP solutions are different. They fit into existing workflows so designers can easily develop customized marketing campaigns, regardless of their complexity, and add to their systems as their needs grow.

EFI Fiery technology delivers fast, industry-leading, adaptable VDP capabilities, and allows Fiery users to choose any authoring tool to create static and variable elements with flexible and open, end-to end VDP solutions. They use the most comprehensive array of VDP languages, such as Fiery FreeForm™, the open-standard personalized print markup language (PPML), PDF-VT, and a host of proprietary languages. All this lets print providers take advantage of evolving VDP technologies — regardless of the brand of database management system, generator software, page-layout program, or print device.

The Fiery Command WorkStation interface manages the inputs and outputs for even the most complex VDP jobs. This allows users to manage their Fiery servers and VDP jobs from one location. The VDP Resource Manager utility enables print production shops to store, view, and reuse RIPped objects on networked Fiery servers. Using it in conjunction with a high-speed printing device and a Fiery server, shops can eliminate production bottlenecks, and print VDP jobs faster than ever before.

Using proprietary and partner technologies, EFI delivers high-performance, open VDP solutions. EFI also continues to work with the most respected partners in the industry to enhance its integration with the latest solutions and existing VDP workflows.

For more information, visit the [Fiery VDP solutions web page](#).

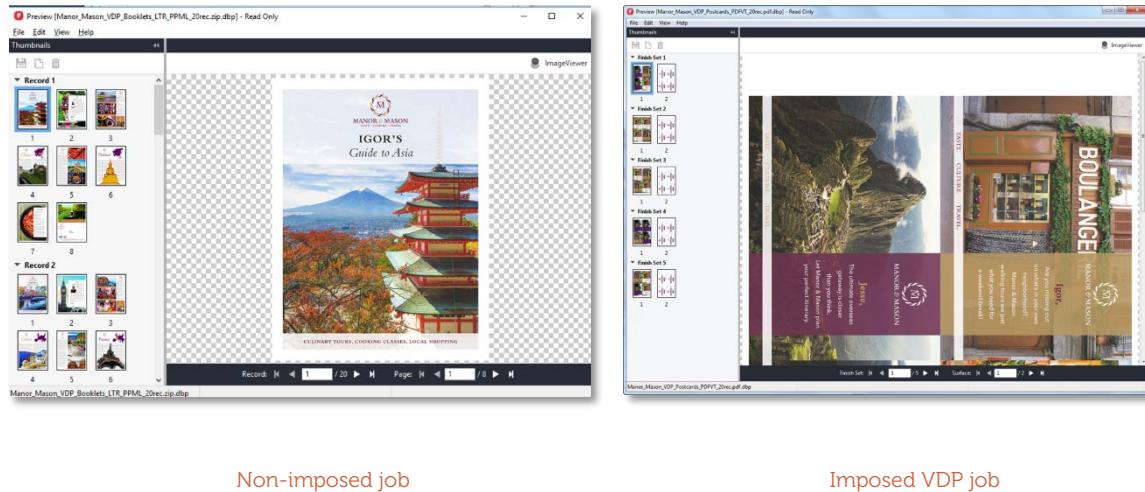

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery VDP Raster Preview

The Fiery VDP Raster Preview enables users to view the content of the job, organized by records or finished sets, and to navigate either by records/finished sets or by pages/surfaces. The job is displayed in actual size, and the user can use scroll bars to see the whole image. This way, users can verify whether the record boundaries for imposed and non-imposed jobs are correct before printing the job. The feature is available when using System 10/10e with Command WorkStation 5.4 or later.

Benefits:

- Enables users to verify record boundaries for imposed and non-imposed jobs within the raster preview, without the need to print the job — reducing potential errors and waste
- Displays records for non-imposed VDP, and finished sets for imposed VDP jobs
- Saves time and eliminates waste because users do not have to guess how the job will print

Non-imposed job

Imposed VDP job

VDP file formats supported by Fiery servers

Fiery servers are compatible with all these file formats, so you can use any of them.

PPML — PPML was designed to support efficient job resource reuse. By allowing the DFE to know early on which fonts, logos, diagrams, images, or other resources are needed at a particular point in the job; the DFE can rasterize that resource a single time and use it as many times as needed without redundant processing. Fiery DFEs are compliant with PPML 3.0 as set forth by the Print-on-Demand industry initiative.

Creo VPS 1.5 — A fundamental benefit of the Creo variable print specification (VPS) is its ability to specify which elements of a variable-data print job will be used multiple times. Once specified, the application will eliminate multiple downloads of repeating data elements to the printer or digital press. This prevents redundant data handling and helps variable-data print jobs to print at or near rated engine speed. Fiery servers are compatible with the Creo VPS format, so users can RIP and print jobs in the Creo VPS format.

VI Compose (VIPP/VPC) — Available on Fiery servers driving Xerox print engines only, this open language from Xerox enables the highest-performance output in variable data PostScript documents.

PDF/VT — PDF/VT is a standard developed by the International Organisation for Standardisation (ISO) for VDP data exchange. Fiery servers are compliant with PDF/VT through both CPSI and APPE.

Fiery FreeForm — FreeForm is an EFI-exclusive variable data output format for Fiery FS350 and earlier servers. With FreeForm, a single master document can be merged with each variable record. The Fiery server processes the master once, then applies that master to each variable record. This delivers a significant performance improvement over mail merge functions in applications like Microsoft Word or Adobe InDesign, where the final file contains the master with every variable record in a static PDF — meaning that the master has to be processed over and over again. FreeForm can be used in two different ways:

- Fiery Command WorkStation or the Fiery driver: requires separate PDFs containing the master and variable content, and the user maps the master to the appropriate pages in the variable PDF.
- Fiery FreeForm Create: FreeForm Create is a stand-alone, free, visual VDP creation application that utilizes Fiery FreeForm technology. It provides a much more user-friendly interface to merge master

Fiery FS400 / FS400 Pro print servers – Product guide

and variable content, plus offers powerful capabilities not available in Command WorkStation or the driver.

Fiery FreeForm Plus – A new output format exclusively for FS400/FS400 Pro servers, Fiery FreeForm Plus delivers greatly improved usability and enhanced VDP capabilities.

Benefits:

Offers open VDP implementation, ensuring compatibility in all VDP workflows and complete flexibility

Consistent Fiery workflow interface greatly reduces training curve for existing Fiery users, leading to fast adoption and higher productivity

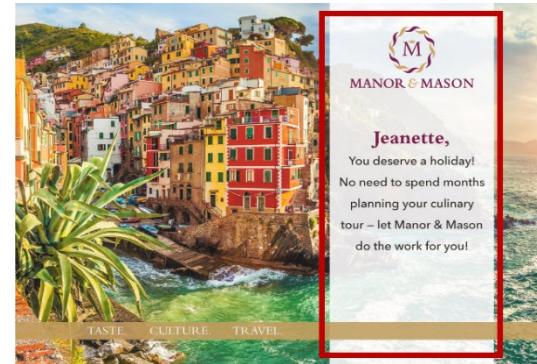

PPML 3.0

PPML 3.0, the latest VDP standard, supports in-RIP transparency flattening. Flattening transparencies as late in the process as possible provides the best results. PPML 3.0 also supports transparency within the PDF layer and between layers. It allows users to print variable layers as designed, and supports the printing of drop-shadow PostScript masks and soft-edge TIFF masks. In addition, it lets users overlay a reusable JPEG image.

Benefits:

Improves design flexibility and user productivity

Eliminates costly file rework

VDP job sample with variable transparent element

Fiery FreeForm

Fiery FreeForm is an exclusive, built-in and simple-to-use VDP file format that supports a wide variety of source applications, without the need for a third-party VDP composition tool. With FreeForm, print providers can enter the market for personalized marketing campaigns and support a multitude of customer requirements with ease. Fiery FreeForm is an ideal entry-level tool that requires minimal skill, so there is almost no learning curve for users. It is available on virtually all Fiery servers, and can create static data masters with any design application.

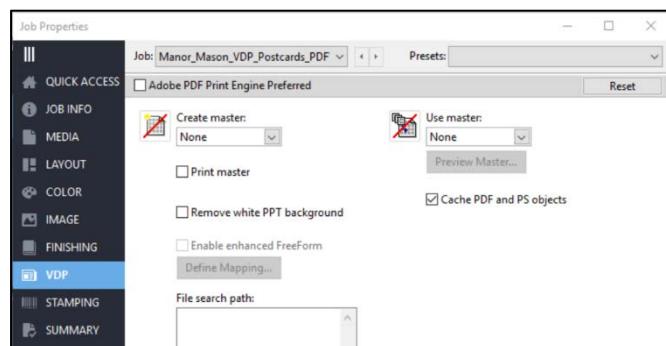

The page length of the FreeForm master document defines each record in a FreeForm job. FreeForm maps the pages from the variable document to the record length defined by the FreeForm master until all the variable document pages are used.

FreeForm Multipage Previews – With bidirectional communication enabled, the EFI Fiery driver provides the user with multipage previews of FreeForm masters. This allows visual confirmation of selected FreeForm masters with static content that spans multiple pages.

Enhanced FreeForm

Prior to System 10/10e, if a page required no variable elements and there was not an exact one-to-one correspondence between the number of pages in the variable document and the number of pages in the master document, the user had to add blank pages to the source document to ensure that mapping was handled properly.

As an example, imagine a company needs to distribute a personalized newsletter to its customers. This newsletter has four pages, and only two of those pages – the front cover with the name of the customer and

Fiery FreeForm settings in Fiery driver and Job Properties

Fiery FS400 / FS400 Pro print servers – Product guide

a personalized image, and the back cover with the mailing address and a custom ad — contain variable information.

Master Pages

Variable Pages

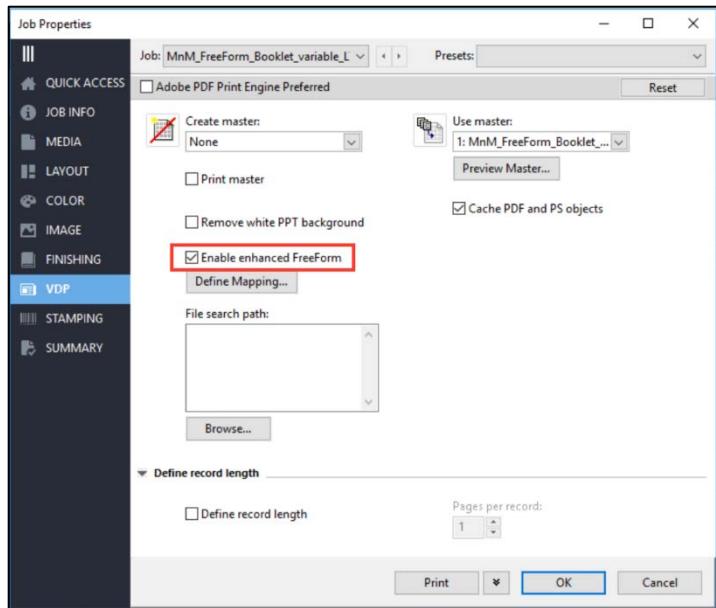

Personalized four-page newsletter with only two variable pages

FreeForm has been enhanced to give the user control over the mapping between the variable and master documents. This provides several benefits. First, instead of adding blank pages to the source variable document, the user can **map** a blank page to a master page. Second, the user can pick and choose which master page a given variable page uses. And finally, the user can define the length of the record, instead of having to use the entire length of the master document.

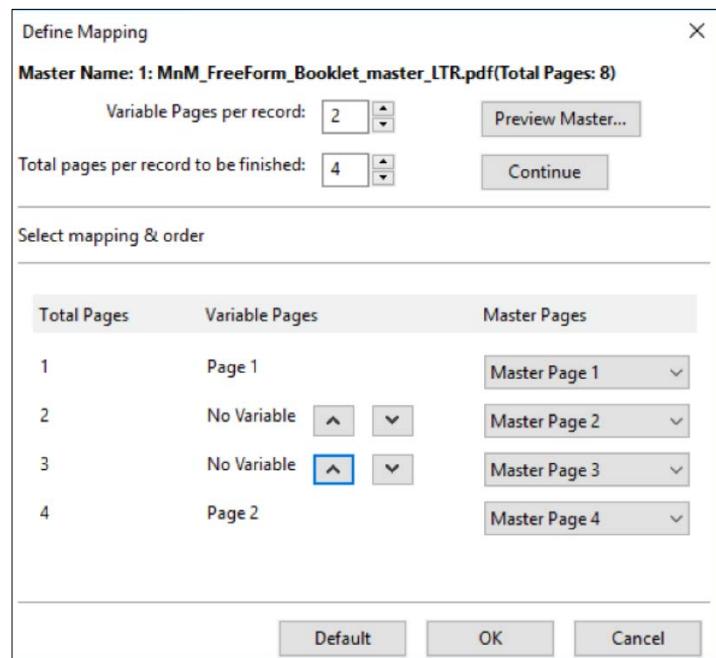

The Enhanced FreeForm settings can be accessed from Command WorkStation Job Properties, Virtual Printers, Presets, Fiery Hot Folders, and in Windows and Mac drivers.

Users can choose Enhanced FreeForm from the Job Properties VDP tab by selecting a master document from the Use Master drop-down menu.

Fiery FS400 / FS400 Pro print servers – Product guide

Users can choose Enhanced FreeForm from the Job Properties VDP tab.

Total Pages	Variable Pages	Master Pages
1	Page 1	Master Page 1
2	No Variable	Master Page 2
3	No Variable	Master Page 3
4	Page 2	Master Page 4

Default OK Cancel

Using the Define Mapping table, users can associate the variable pages with the corresponding page of the master document.

Benefits:

Simplifies creating and using VDP documents by allowing users to map variable documents to master documents without modifying the source documents

Offers the flexibility to pick only a subset of pages from a master document, and use the selected pages with the variable record in any order

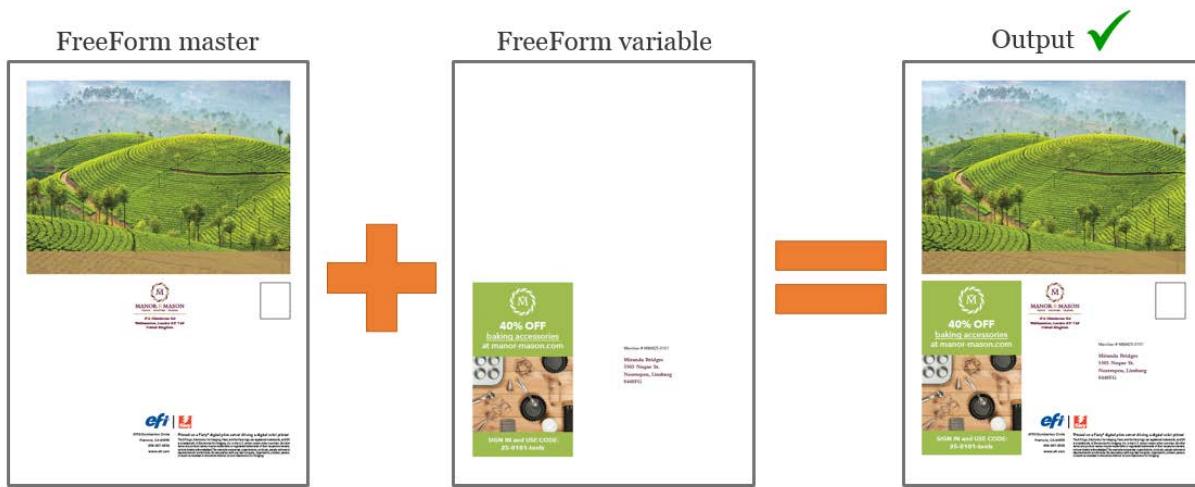

Lets users create powerful personalized print jobs using standard tools, without the need for additional VDP software

Fiery FreeForm master on top

This feature provides the option of merging content from a FreeForm master on top of variable content during job processing, preventing the variable content from obscuring master content in some designs for personalized jobs.

Fiery FS400 / FS400 Pro print servers – Product guide

Most common FreeForm uses expect the master content to be a background layer for the variable content. An example is the use of a FreeForm master file as a document letterhead, with the FreeForm variable file as the content of the letter. In this workflow, none of the variable elements overlap any of the master file elements, and the job prints as expected as shown below.

Personalized output looks correct regardless the order the master is processed

Some applications may have a FreeForm variable file with background elements such as a picture that would overlap and obscure the master data.

Variable content obscures the master content due to processing the master as a background layer

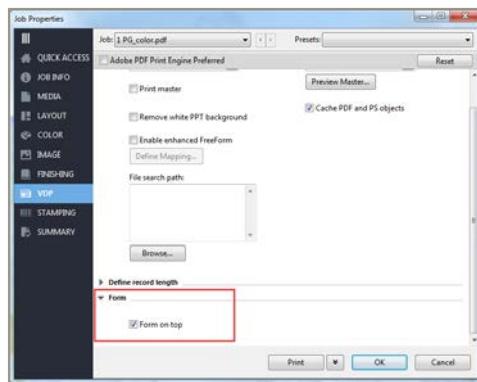

The FreeForm master on top feature gives users extended flexibility in the design for variable data applications. It is also useful when using specialty colours such as clear, white or neon.

Fiery FS400 / FS400 Pro print servers – Product guide

Correct output using the FreeForm master on top feature

The setting is a check box that can be found inside the VDP tab in Job Properties.

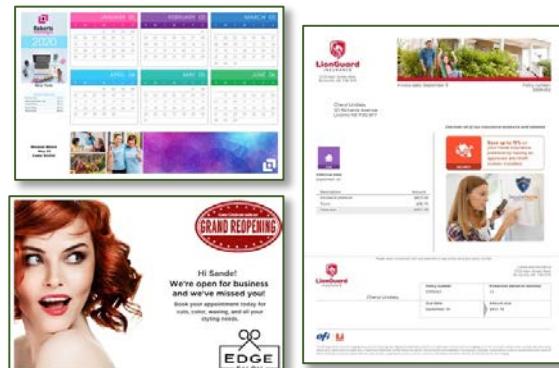

Fiery FreeForm Create

[Fiery FreeForm Create](#) is a free, stand-alone variable data creation application for external and embedded Fiery servers. It leverages Fiery FreeForm technology and allows the users to quickly and simply personalize existing files for free in an intuitive interface and add variable elements such as text, images, and barcodes with just a few clicks. It's ideal for applications such as business cards, diplomas, calendars, postcards, booklets, direct mail, labels, parking passes, newsletters, and so much more.

For Print Service Providers (PSPs) or in-plants

Fiery FreeForm Create provides a great opportunity to get started with personalisation for free. With the ability to personalize files on the fly, you can provide more value-added services to your customers. And for PSPs or in-plants who are already familiar with VDP, FreeForm Create may provide a more efficient or cost-effective method for personalisation compared to your existing processes.

For creatives/designers/marketers

Since access to a Fiery server is not required to run FreeForm Create, anyone can use it! It's a great resource for creative professionals, designers, or marketers who want to create their own print-ready, personalized files in a visual interface. The files are saved out of the application in a packaged format that can be provided to a PSP or in-plant for production.

For office workers

Fiery FreeForm Create is an easier and faster way to create personalized files compared to mail merge functionality in Microsoft Word or Adobe InDesign. Rather than create a large document where static

Fiery FS400 / FS400 Pro print servers – Product guide

elements are repeated over and over (increasing file size and process time), FreeForm Create outputs an optimized file that's smaller and more efficient, which, in some cases, processes up to 80% faster than a traditional mail merge.

For packaging producers

FreeForm Create is a free, more efficient alternative to creating variable content than using plug-ins to InDesign or Illustrator. And it delivers many of the same capabilities as paid VDP applications, like variable text, images, or barcodes. Packaging producers can personalize customer packaging to help increase the impact, or for subscription-type packaging, you can use FreeForm Create to include targeted information on box contents, or even include other offers that the customer could benefit from. Also, packaging producers can use the barcode capabilities in FreeForm Create to identify each unique board to track it through the manufacturing process and help track any errors that occur through finishing. And a barcode can be used to track individual packages after they've shipped, in case issues arise later with the contents.

Fiery FreeForm Plus

Fiery FreeForm Plus is a brand new, proprietary VDP format that's available exclusively for FS400/FS400 Pro users within the Fiery FreeForm Create application. FreeForm Plus delivers greatly improved usability and enhanced VDP capabilities.

Single file package

FreeForm Plus combines all resources needed for a job (including both master and variable content) into a single file package, which is then submitted to the Fiery server. By completely merging all the content, users enjoy the following benefits:

A single file package provides many of the benefits of open source VDP formats such as PDF/VT or PPML, all of which require a paid application to create. This capability is available for free on Fiery servers, since the file package can be re-opened and edited in FreeForm Create.

With a single file package, correlation between master and variable page sizes is removed, which may make it easier to configure some applications, like applying an imposition template, selecting a media size, configuring specialty colours, or setting other attributes in Job Properties, on the engine and Fiery server.

New file import options

Users can submit .ffp files (proprietary FreeForm Create file packages) to the Fiery server through the FreeForm Create application, Fiery Hot Folders, or directly into Fiery Command WorkStation. This enables the following benefits:

Choose the file submission method that works best for specific workflows

Get an alternative job submission method that does not require Fiery server login from FreeForm Create

APPE support

FreeForm Plus files submitted to the Fiery server can be processed using Adobe PDF Print Engine (APPE). Previously, FreeForm Create files could only be processed using the PostScript interpreter.

This table summarizes the capabilities of FreeForm Plus in different Fiery system software versions.

	FS400 Pro and FS400 and later	FS350 Pro and FS350 and before

Fiery FS400 / FS400 Pro print servers – Product guide

FreeForm Create output file format (as seen in Command WorkStation)	.ffp (FreeForm Plus)	.ffc (traditional FreeForm file with separate master and variable content)
Single file package submitted from FreeForm Create to the Fiery server Including master and variable content such as data source, images, etc.	Yes	Yes, FreeForm Create creates a FreeForm master and FreeForm overlay with correct job properties to link both jobs.
FreeForm Create proprietary format support (saved file packages, .ffp)	Yes	Yes
Submit file to Fiery server from FreeForm Create	Yes	Yes
Submit FreeForm Create file to Fiery Hot Folder or direct import into Command WorkStation	Yes	No
Requires separate RIPping of master and variable content	No	Yes
Matching page sizes for master and variable content	More flexible	Master and variable content must have the same page size
Transparency support	Yes	No
APPE support	Yes	No – only PostScript supported

Fiery FreeForm Kit

The [Fiery FreeForm Kit](#) is a set of resources designed to help you learn how to use the Fiery FreeForm Create application to its fullest potential. See examples of variable data documents, created using FreeForm Create, that utilize variable text, images, and barcodes. These examples serve as templates and can be used as customer samples to show what is possible with variable data printing, or to provide inspiration for the types of personalized applications that you can create for your customers.

What's in the Fiery FreeForm Kit?

- Source files for all FreeForm Create demo files, including packaged InDesign files and images
- Master PDF and data source files for samples that utilize the FreeForm Create variable data workflow
- Master and variable PDFs for use with the file merge workflow
- Pre-programmed .ffp files that can be opened in FreeForm Create
- Overview guide with tips and tricks for Fiery FreeForm Create

Fiery FS400 / FS400 Pro print servers – Product guide

VDP Resource Manager

The Fiery VDP Resource Manager presents a list of the repeatable elements (source and cached) that are stored for future use. Users can find the VDP Resource Manager in the Device Center, in VDP Resources under the Resource section.

Key functions and features:

Easy to navigate with an intuitive user interface

View a list of repeatable elements, categorized by VDP file format

See a thumbnail preview of elements; as well as their name, size, and creation date

Archive or delete dated or redundant files

Troubleshoot problem files and reduce production bottlenecks with a single view of all VDP resources on all of the Fiery servers in the printshop

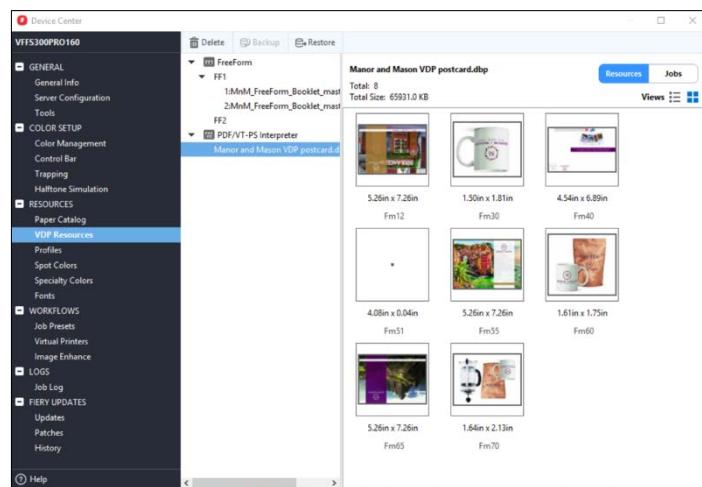

Choose from a list or thumbnail view (thumbnail view provides a visual illustration of resources)

View a list of jobs in the Hold queue that are associated with a selected resource

Delete all the resources in a print environment

Back up and restore resources

Automatically refresh stored VDP resources when a new VDP file is processed

VDP Resource Manager in Device Center

Benefits:

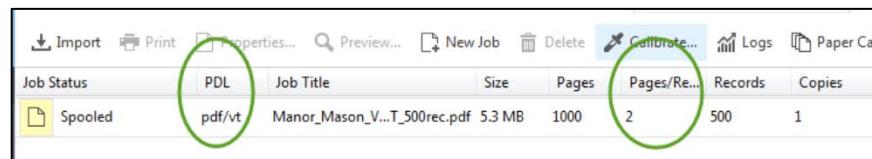

Quick identification and verification of cached VDP elements

Optimizes management of VDP resources that can be leveraged by future jobs in FreeForm, PPML, VPC, and VIPP formats

PDF/VT support

Efficiently driving complex VDP jobs in digital print environments requires support for multiple standards to ensure interoperability. Fiery servers are compliant with PDF/VT, a standard developed by the ISO for VDP data exchange, through both CPSI and APPE. Support for PDF/VT brings the benefits of a PDF workflow to VDP, which helps print providers increase production efficiency with capabilities such as late-stage exchange of critical variable content.

The system processes PDF/VT files the same way it handles other VDP files — by detecting records defined in the PDF/VT job and caching reusable Xobjects — and displays a format icon for PDF/VT jobs on the Fiery Command WorkStation.

The format icon, as well as the quantity of records and pages per record, identifies PDF/VT jobs in Command WorkStation.

Benefits:

Folds seamlessly into existing PDF-based prepress operations, enabling a single common PDF print production workflow for all job types

Easier to use, with a visual illustration of cached, reusable elements and easy identification of VDP jobs

Fiery FS400 / FS400 Pro print servers – Product guide

Increases productivity with support for users' existing workflow

PDF/VT-2 support

PDF/VT is Adobe's variable data language, based on PDF technology. PDF/VT-1 support was introduced in Fiery System 10 servers, and PDF/VT-2 is supported on Fiery servers running FS100 Pro and above. The Fiery server recognizes the new PDF/VT file type and shows a different icon in Command WorkStation for this format. It automatically extracts the records information and displays the number of records and pages per record, showing PDF/VT cached resources in the VDP Resource Manager. Fiery servers support PDF/VT for both CPSI and APPE interpreters. PDF/VT-2 gives users a performance improvement because PDF/VT files can refer to resources through a file search path so that they can be processed inline, but the overall PDF/VT file size being transferred is reduced. With PDF/VT-1, all of the resources had to be contained inside the file.

See this Adobe whitepaper for more details: fiery.efi.com/PDFVT-whitepaper-en

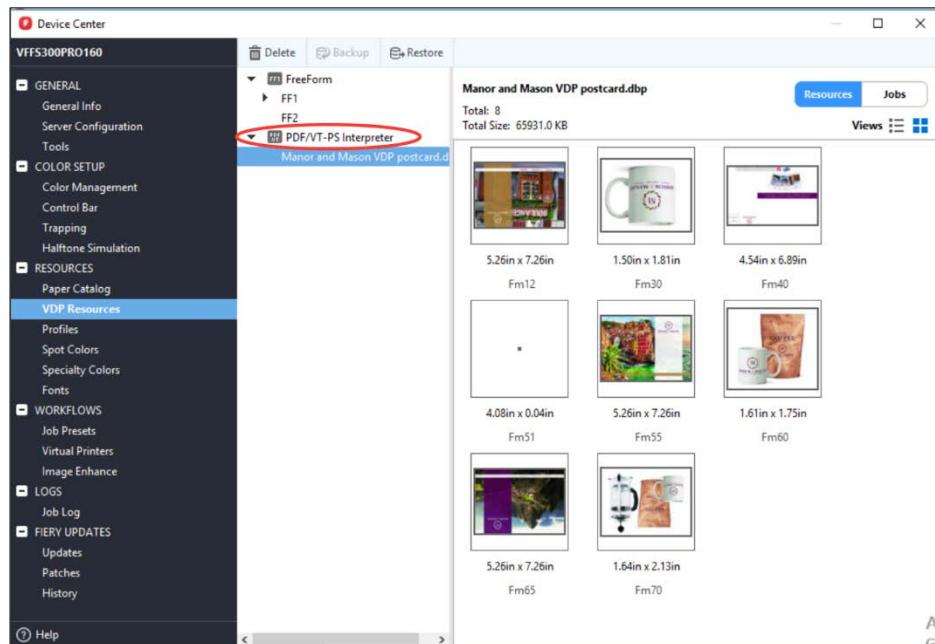

Import	Print	Properties...	Preview...	New Job	Delete	Compose...	Logs	Paper Cat
Job Status	PDL	Job Title	Size	Pages	Pages/Re...	Records	Copies	
Spoiled	pdf/vt	Manor_Mason_V...T_500rec.pdf	5.3 MB	1000	2	500	1	

PDF/VT is displayed as a file type in Command WorkStation; the number of records and pages per record are also displayed.

Benefits:

Supports the latest VDP standard so that users can confidently print any standard VDP data stream

Adds flexibility to customer workflows

PDF/VT file format under VDP Resource Manager

Fiery Hot Folders filter for PDF/VT support

Fiery Hot Folders support PDF/VT. Selecting the PDF/VT checkbox grays out all other PDF options, ensuring that hot folders pass the PDF through to the Fiery server without any processing or modification, so the variable components are preserved.

Benefits:

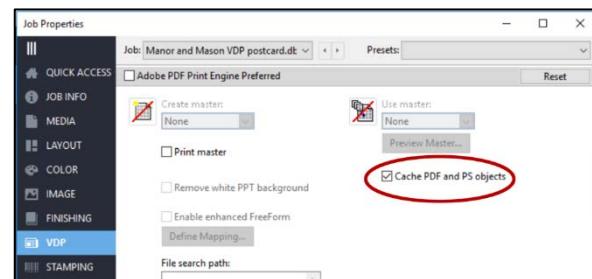

Adds flexibility to customer workflows

Automates job settings in Command WorkStation without user intervention

Processing optimisation for PDF and PostScript VDP files

Some customers use PDF or PostScript formats for creating VDP jobs. PDF uses Xobjects, and PostScript uses Forms, to convey information about repeating objects in the file. Prior to System 10/10e, Fiery servers supported the PDF Xobjects. Now, they also support PostScript files with Forms. Users can gain a huge performance boost by using the information from PDF Xobjects and PostScript Forms to RIP the repeatable elements only once and then cache them.

This feature is available in both the CPSI and APPE processing paths through the VDP tab of Job Properties.

Benefit:

Increases speed and performance while processing PDF and PostScript format files in VDP applications

Define Record Length

In VDP workflows where VDP applications generate PostScript or PDF files as output formats, print servers don't have a way to know the number of records in the job, or how many pages the records contain. Consequently, some finishing options such as VDP imposition or subset finishing with Mixed Media will not be fully functional.

In order for the correct finishing options to be available to such jobs, and to allow for PostScript and PDF files to be processed as VDP jobs, users need to be able to define these parameters.

Define Record Length allows a user to define the fixed record length for a VDP job when it is provided in PostScript or PDF format. This Define Record Length setting can be found in the Fiery driver and Job Properties utilities. Two new columns display this VDP job ticket information on Command WorkStation:

Number of Records: Displays the number of records contained in the file

Pages per Record: Displays record length information with variable record lengths displayed as a range, from smallest to largest

Benefits:

Allows VDP jobs imported in PostScript and PDF formats to be correctly processed with the desired finishing requirements

Reduces waste by allowing users to print a selected set of records

Provides additional VDP job information, allowing users to prepare and troubleshoot VDP jobs more efficiently

Record level finishing support

Fiery systems support individual VDP set (record-based) finishing for VDP jobs. In such cases, finishing settings inside the Job Properties window will be applied at the record level, as opposed to the job level.

There are no special user-interface requirements for VDP set finishing. Finishing options previously applied globally to a job will now be applied to each individual record inside that job. All records inside the job will be treated identically. VDP set finishing is applied to all content between the start and end marks.

The following VDP file formats have native definition on the start and end of a VDP set, and therefore support subset finishing:

FreeForm v1 and v2

PDF/VT

PPML

VI Compose (VIPP/VPC – Xerox only)

Creo VPS

Fiery FS400 / FS400 Pro print servers – Product guide

Benefit:

Increases automation of the output process and reduces the number of manual offline steps in production

VDP Record Range Printing

Reduces waste and lost time by allowing the user to select a range of records to be printed from a VDP job as a Command WorkStation override. The Record Range Printing feature for VDP jobs is supported for both non-imposed and imposed VDP jobs in FreeForm v1 (record-based) and FreeForm v2, PDF/VT, PPML, VI Compose (VIPP/VPC – Xerox only), and Creo VPS formats.

Benefits:

Simplifies record reprinting: For example, if you need 4 of 100 records, you don't have to process the whole job to just print those records

Reduces waste by allowing the user to print a selected set of records

VDP Multi-Up Booklet

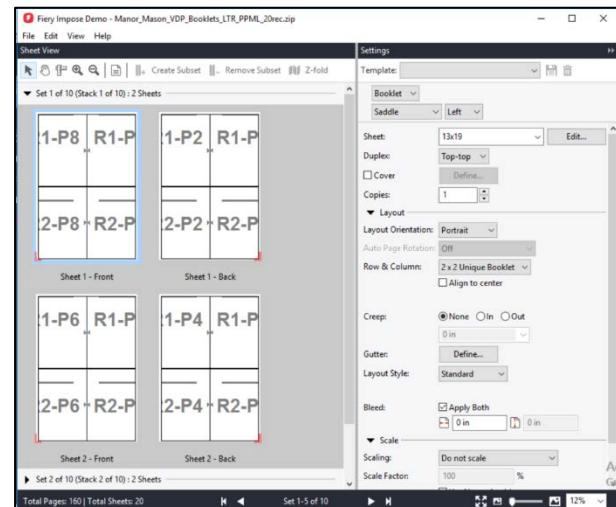

VDP Multi-Up Booklet is a Fiery Impose feature that allows two records to be printed on a sheet, reducing costs by printing on a larger sheet size for a single click charge. Users can find it through Fiery Impose, and can save settings as an Impose preset they select from Virtual Printers or Fiery Hot Folders for automated job submission.

For records of different lengths, blank pages will be positioned automatically – based on pagination requirements. If covers are not enabled, the blank pages should fall at the end of the job. Otherwise, with covers enabled, the blank pages could fall somewhere in the middle after the job is folded during offline finishing.

Benefits:

Allows faster throughput by producing a job using fewer sheets and fewer clicks

Reduces costs by printing two records on a larger-sized sheet

Record 1 and Record 2 booklets print on the same sheet

Fiery FS400 / FS400 Pro print servers – Product guide

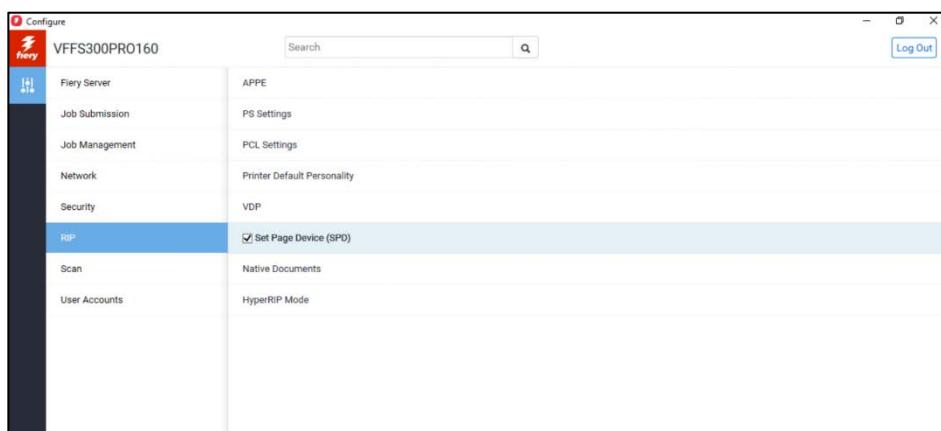

Transactional printing

Set page device support

The term set page device, also known as setpagedevice, refers to a group of PostScript commands that describe the printing characteristics of a file. This includes things such as paper attributes, finishing options, and number of copies. These commands are primarily used for specialized applications that require dynamic mixed media; or data-driven mixed media such as transactional applications that have a variable number of pages per document, where media requirements may be different for each page.

Set page device support lets Fiery servers translate or map the paper attributes to the Fiery Paper Catalog, and finishing options to specific output bins. This eliminates the need for human intervention, saves time, increases productivity, and automates workflow.

Users enable set page device in the Device Center, and select it in Job Presets, Virtual Printers, or Fiery Hot Folders for automation. Set page device commands can only be used with PostScript base languages (PS, VPS, VIPP), and are not device dependent.

Enabling set page device in Configure

Once set page device Media Mapping is activated, users need to define the actual media and finishing mapping in Job Properties.

Defining media and finishing mapping in Job Properties

If print operators want to see and verify the embedded set page device commands in the PDL file, they can use Fiery Preflight (part of Fiery Graphic Arts Package, Premium Edition) to generate a report of the commands in the file.

Benefits:

Increases productivity with support for the user's existing workflow

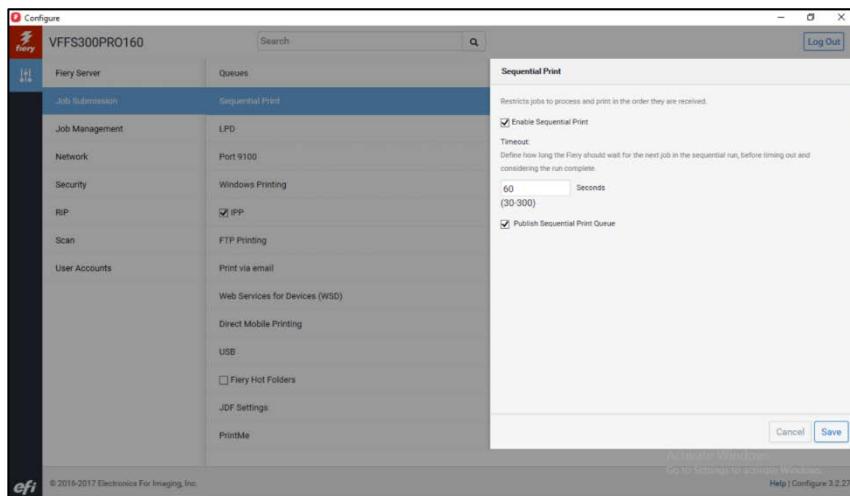

Automatically prints set page device embedded files without user intervention, to save time and increase productivity

Fiery FS400 / FS400 Pro print servers – Product guide

Sequential Printing

Sequential Printing guarantees that jobs print following one another in first-in, first-out printing order. For example, in transactional printing, jobs need to be printed and mailed in a certain order. Another example is chapters in a book. The Sequential Print queue feature guarantees that all jobs print in the order submitted, and prevents smaller jobs from skipping ahead of larger jobs that are still spooling.

Users enable a Sequential Print queue in the Configure tool under Job Submission, as shown in the screenshot below. It also requires the administrator to define a “time-out.” The time-out defines how long the Fiery server should wait for the next job in the sequential run before timing out and considering the run complete.

Enable the Sequential Print queue in the Configure tool.

Once enabled, the system publishes a new default Print queue called Sequential Print. Users can add new Virtual Printers and Fiery Hot Folders using the Sequential Print queue, as shown in the screen shot.

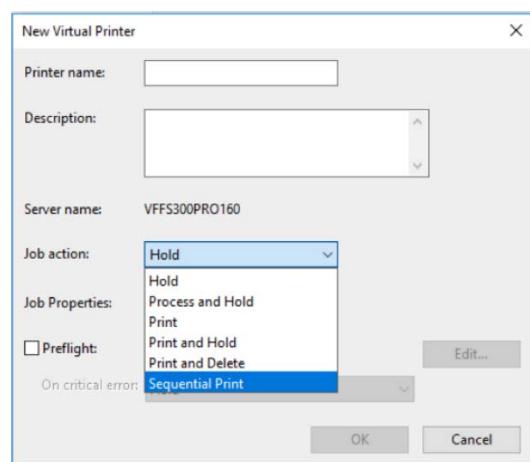

Sequential Print jobs can be submitted through Fiery Hot Folders, Virtual Printers, Command WorkStation, JDF job ticket, or directly through a network protocol such as SMB, LPR, or Port 9100.

Sequential printing begins when the first file is spooled to the Sequential Print queue. Each Sequential Print run will display a unique group ID icon. When a Sequential Print run starts, other print jobs will wait to process until the Sequential Print run is completed.

While a Sequential Print run is taking place, the Fiery server will still allow the user to select actions such as Rush Print, Process Next, Print Next, Suspend on Mismatch, Preview, Hold, and Cancel. These actions will override and disrupt the Sequential Print run.

Benefit:

Offers a way to ensure job production in a specific sequence, such as a variable printing application for postal sort

A new default print queue called Sequential Print is published

Document-based banner pages

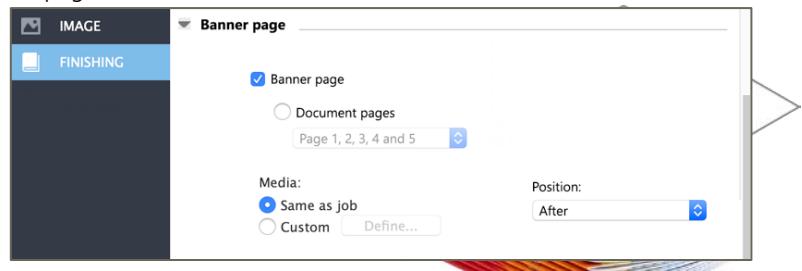

Banner pages are a helpful resource that can help streamline the management of printed output and its distribution. These pages are printed right after a copy is done printing and facing up.

Fiery FS400 / FS400 Pro print servers – Product guide

Document-based banner pages allows pages within a document to print as banner pages. This lets Fiery users customize the content of banner pages to fit their specific needs in output handling and distribution.

As the example illustrates on the right, the banner page can consist of more than one page, and have custom content such as barcode and a company logo. The first banner page can be sent to the Finance department for cost accounting purposes, while the other is used by the Shipping department for distribution instructions. The banner pages can print on a different media than the job and output on a different tray.

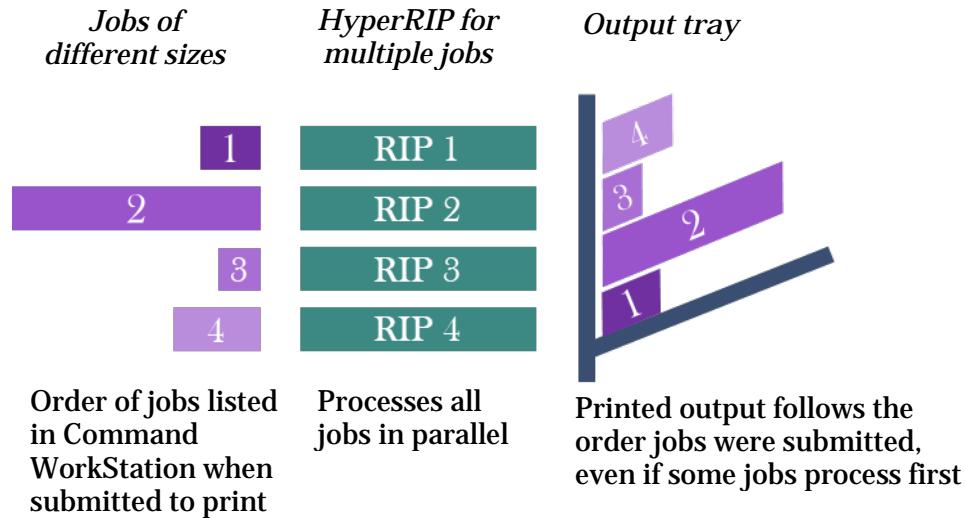

This feature is not supported for VDP or imposed jobs.

Strict ordered printing

This feature ensures jobs print in the order they are listed when selected to print from Command WorkStation. It offers a predictable order of the printed output to guarantee a streamlined finishing and distribution processes.

Advanced job management features such as Rush Print and Print Next can be used to override the strict order rule.

Fiery FS400 / FS400 Pro print servers – Product guide

Management

Fiery Command WorkStation is the main job and device management interface for Fiery Driven printers where local and remote users can manage Fiery servers from various print engine manufacturers, do colour management, submit jobs, prepare and preview jobs before printing, and more from Mac and PC client workstations. The visual, intuitive interface lets users get jobs done faster and with fewer clicks, saving time and money. Updates to Command WorkStation are free, and can be downloaded by all Fiery server customers at efi.com/cws.

These are the standard configurations for each Fiery server platform and system version combination. *For information on a specific Fiery server model's feature set, refer to the datasheet for that model, or ask your Fiery vendor about support for a specific feature.*

Job and device management tools

Fiery Command WorkStation

Fiery® Command WorkStation®, the print job management interface for Fiery servers, makes printing more productive and powerful. It centralizes job management, connects to all Fiery servers on the network, and improves productivity. The intuitive interface simplifies job management, regardless of the user's level of experience.

Full cross-platform Apple® macOS® and Microsoft® Windows® support provides a consistent look and feel, plus the same functionality across computing platforms. A fully functional remote connection to a Fiery server provides the same quality results as with a local connection for server administration. Fiery Command WorkStation 6.5 updates also enhance usability for Fiery servers running FS100 and above, and Fiery XF 7 and above.

To download the latest version of Command WorkStation, and to learn more about new features, visit efi.com/CWS.

Fiery Command WorkStation Package

Fiery Command WorkStation 6.5 is part of the Fiery Command WorkStation Package. The Fiery Software Manager handles the download and installation process for this package.

Fiery Command WorkStation 6.5

Version 6.5 introduces a wealth of new productivity, management, colour & imaging, and connection functions that make Fiery Command WorkStation more efficient than ever before.

Centralizes job management by controlling any Fiery Driven™ cutsheet, wide, superwide, or high-speed inkjet printers on the network for improved real-time productivity.

Fiery Command WorkStation 6.5 includes the following licensed makeready software: Fiery Impose, Fiery Compose, and Fiery JobMaster™; as well as prepress software including: Fiery Graphic Arts Pro Package, Fiery ColorRight Package, and Fiery Automation Package¹.

Fiery Hot Folders

Automates job submission processes for repetitive tasks, saving time and reducing print errors with a simple drag-and-drop operation.

Fiery Software Uninstaller

Easily removes Fiery applications, Fiery Driven printers, and associated print drivers/files on macOS clients.

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery Software Manager

In addition to the Command WorkStation Package, the Fiery Software Manager also enables installation of these Fiery applications:

Fiery FreeForm Create

Create personalized jobs using Fiery FreeForm™ VDP technology. Easily add variable elements such as text, images, and barcodes to existing files.

Fiery Remote Scan

This application allows users to retrieve scans from a copier and save them, or import them directly into a compatible application. Now a standalone application, users can choose to download and install it on their client workstations.

Fiery JobFlow – Windows only

Fiery JobFlow enables prepress workflow automation for streamlined job processing and printing. Start with the free Fiery JobFlow Base to manage workflows including PDF conversion, Fiery Preflight, image enhancement, document imposition; plus flexible options for job submission, archiving, and output. Upgrade to the paid Fiery JobFlow version to add more intelligence with rules-based workflows; advanced preflight and PDF editing, powered by Enfocus Pitstop; and cloud-based JobFlow approval process for maximum efficiency.

To use Command WorkStation 6 and JobFlow on the same client, you need to update JobFlow to version 2.2.3 or later.

Fiery Color Profiler Suite

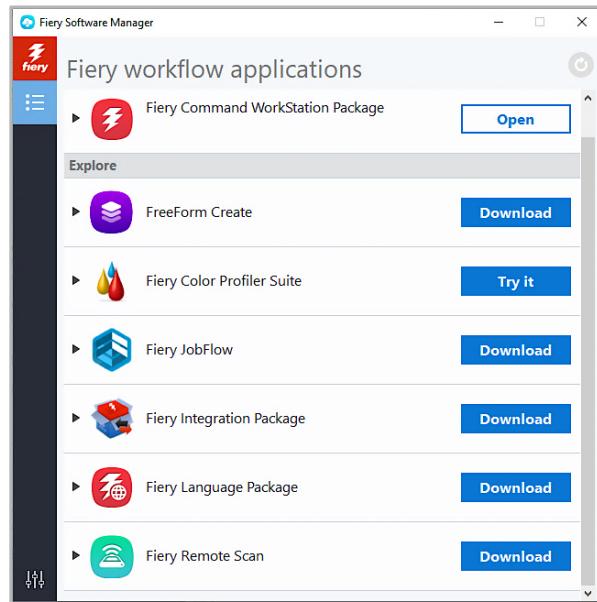

The Fiery Color Profiler Suite software provides integrated colour-management functions and quality control for print systems. It extends the colour capabilities of Fiery Driven printers with the most advanced tools available for profile creation, inspection, editing, and colour quality assurance. Modular functions ensure colour accuracy and consistency across design, print production, and office applications for all types of substrates, while increasing productivity and return on investment.

Fiery Integration Package – Windows only

Fiery Integration Package includes Fiery JDF 1.5.1 and Fiery API 4.0. The Windows application can update both Windows and Linux-based Fiery servers. Users must select "Show additional features" in Fiery Software Manager preferences to see the Fiery Integrated Package listed for download.

Fiery Integration Package – Windows only

Installs additional language packages in the Fiery server to display a fully localized interface in Command WorkStation.

Fiery Software Manager

Fiery FS400 / FS400 Pro print servers – Product guide

Specifications for Fiery Command WorkStation Package

Software applications in Fiery Command WorkStation Package can connect to and be installed on:

Fiery servers running Fiery software: Fiery XF7 and above, Fiery FS100/100 Pro, Fiery FS150/150 Pro, Fiery FS200/FS200 Pro servers, Fiery FS350/FS350 Pro, and Fiery FS400/FS400 Pro.

Mac OS clients:

- macOS X® 10.13 and newer
- 4 GB of RAM or more recommended
- 7 GB of available hard drive space
- Minimum display resolution:
 - o For cutsheet users: 1280 x 1024
 - o For wide and superwide users: 1600 x 900

Windows clients:

- Processor: Intel® Core™ i3 or faster processor
- Microsoft Windows 7 SP1, 8.1 (April 2014 update); and Windows 10, 64-bit, and newer
- Microsoft Windows Server 2008 R2 SP1, 2012 R2 (April 2014 update), 2016— 64-bit, and 2019
- 4 GB or more of RAM
- 16 GB of available hard drive space
- Minimum display resolution:
 - o For cutsheet users: 1280 x 1024
 - o For wide and superwide users: 1600 x 900
- Please note that Fiery Command WorkStation 6.0 and later, Fiery Hot Folders, and Fiery Remote Scan do not connect to Fiery cutsheet servers running Fiery System 10 and earlier, or Fiery Central servers. To connect to those systems, users should install Fiery Command WorkStation 5.8 (for Fiery System 9 and earlier) or 6.4 (for Fiery System 10 and earlier). Find out how to downgrade from version 6.x to version 5.8 by referring to [this document](#).

Find out more about the features in versions of Command WorkStation released after version 6.1 at efi.com/cws.

Section 508 conformance

The Section 508 regulation was enacted in the United States to eliminate barriers in information technology, and to make new opportunities available for disabled people.

The Voluntary Product Accessibility Template, or VPAT®, is a report that describes Section 508 compliance for Fiery Command WorkStation. Obtain the VPAT document [here](#).

Job Tags

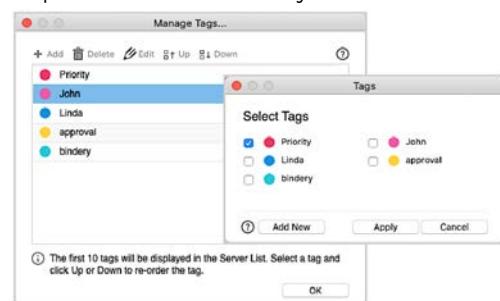

Job Tags provide users with a powerful and flexible way to organize jobs beyond regular job attributes. Operators can create colour-coded “tags” for any custom job attribute such as job priority, customer name, operator, type of off-line finishing, and more. This feature allows print shops to connect their Fiery workflows to their non-Fiery workflows and processes, plus enables easier management and identification of jobs.

Tags can improve print production efficiency by providing benefits such as:

1. Visibility on how many priority jobs are waiting to be printed which can increase the accuracy of scheduling and forecasting
2. Information on who owns a job, or which company a job is for which can speed up communications in case of queries
3. The ability to easily identify a batch of jobs with similar finishing requirements
4. Faster access to the actual workload per operator can help distribute jobs more economically

Operators can:

1. Define up to 50 custom tags
2. Assign 1 of 8 colours to a given tag

Fiery FS400 / FS400 Pro print servers – Product guide

3. Assign up to 5 tags to a single job
4. Assign a tag to multiple selected jobs
5. View, filter, and sort based on tags
6. Easily create, edit, and manage tags

The top 10 tags per server are listed under a collapsible menu item within the Server pane. Clicking on a specific tag within the Server pane creates a custom view, instantly displaying only jobs with that tag assigned in the Job List.

This feature is only available for Fiery servers running cutsheet printers.

Fiery Health Monitor

The Fiery Health Monitor is a new application in Fiery Command WorkStation that helps keep a Fiery server running in its most efficient condition to face the demands of a production print environment.

Fiery Command WorkStation presents a health indicator icon at the top-right corner of the Job Center view that reports the status of the overall system's health in three colours: green, yellow, and red.

Green: Healthy. All server maintenance and preventive actions are up to date

Yellow: Poor health. The Fiery server's health requires attention and some preventive actions are required

Red: Unhealthy. The Fiery server is at risk of operational problems or loss of data if server maintenance procedures are not performed

Fiery Health Monitor presents a list of maintenance and preventive actions to bring the Fiery server back to a healthy green state. Administrators can select to perform recommended actions and are taken to the location where they can proceed to perform the maintenance processes listed below.

The application also offers best-practice recommendations.

Fiery Health Monitor checks on the following issues that help keep Fiery servers in good shape:

Fiery software updates up to date (Fiery FS150 Pro and later)

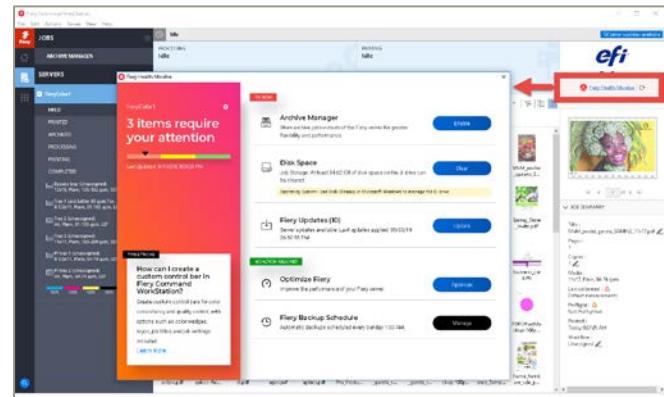

Archive Manager enabled

Scheduled or manual backups performed (Fiery FS200 Pro and later)

Fiery hard disk drive capacity levels

Fiery server optimisation performed within the past week

This table represents the way Fiery Health Monitor determines the health status colour:

Fiery Health Monitor icon and application

Fiery FS400 / FS400 Pro print servers – Product guide

Server maintenance issues	Red	Yellow	Green
Fiery Updates	Updates are pending, and and/or no updates for over 6 months	Any updates are pending, and it's under 6 months since last updates	All available Fiery service packs and Fiery API updates are installed
Scheduled backups	No backup has ever been made	Have manually backed up the Fiery image settings within the last six months	Automatic backup is on
Archive Manager	Archive Manager is not enabled on the client	N/A	Archive Manager is enabled
Hard drive space (on E: drive or embedded disk)	<20% of space is available	20-40% of space is available	>40% of space is available
Optimize Fiery server	Fiery server has not been optimized for >1 month	Fiery server has not been optimized <1 month	Fiery server has been optimized within last week

This feature is available for Fiery servers running cutsheet printers and supported on Fiery System 10 and above.

Auto reconnect

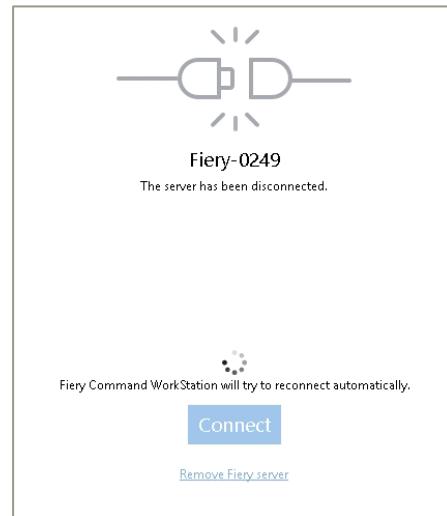

Fiery Command WorkStation may disconnect from a Fiery server in cases such as a network interruption, after the Fiery server performs a scheduled backup, or after the Fiery server restarts. In the past, users had to click on the Connect button to reestablish the connection in order to resume their work.

The auto reconnect feature saves users' time by reestablishing the connection to a Fiery server automatically, using the saved login credentials.

Command WorkStation attempts to reconnect every 30 seconds, for up to 3 hours. After that time, users will need to reconnect the Fiery server manually.

Users can disable this feature in Preferences.

This feature is available for all users of Fiery Command WorkStation.

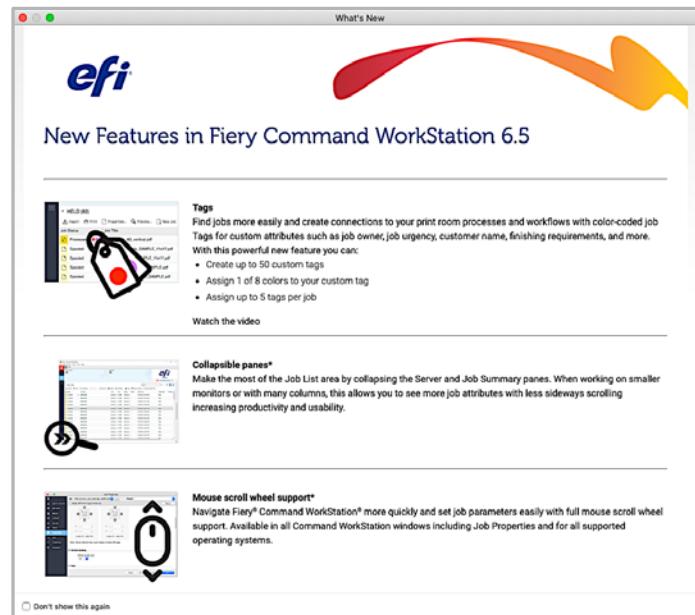

Auto reconnect attempting to resume connection to the Fiery server automatically

Fiery FS400 / FS400 Pro print servers – Product guide

What's new popup

Fiery Command WorkStation greets users after a version update with a What's new popup where they can easily see and learn more about the new features and functionalities of the newly installed version. This window shows at each Command WorkStation launch but can be turned off with a "Don't show again" checkbox. The What's new popup can be retrieved from the Help menu at any time.

What's new popup at launch of Fiery Command WorkStation 6.5

Fiery Smart Search

Fiery Command WorkStation offers a way to search for Fiery related information and training content that users may need quickly.

Users access this feature in Job Center by clicking on the Fiery Smart Search icon (magnifying glass) on the bottom-left of the Fiery sidebar. This presents a search field where users can type the search term and press "Enter" to display the search results. The search window displays 10 results at a time. After clicking on one of the search results, the page opens in a separate web browser.

The search results come from:

- Help documentation
- EFI Communities postings
- Fiery How-to guides
- Fiery product guides

The screenshot shows the Fiery Command WorkStation interface. The sidebar on the left has tabs for 'JOBS', 'ARCHIVE MANAGER', and 'SOURCES'. The main area shows a list of jobs under 'HELD' and 'PROCESSING' categories. In the bottom-left corner of the sidebar, there is a blue circular icon with a white magnifying glass symbol, which is the 'Smart Search' icon. To the right of the sidebar, a search results window is open with a red border. The title of the window is 'Server presets'. It lists several items such as 'Edit, delete or unpublish Server Presets', 'Export and import Server Presets', 'Server Presets', and 'About locked server presets'. Below this, there is a table of server configurations with columns for 'Name', 'Status', 'Size', 'Last Modified', and 'Actions'.

Fiery Smart Search icon and search results

Fiery Smart Search offers faster access to the vast Fiery knowledge base.

Additional free online training is available at [Learning@EFI](#).

This feature is available for all users of Fiery Command WorkStation.

Fiery FS400 / FS400 Pro print servers – Product guide

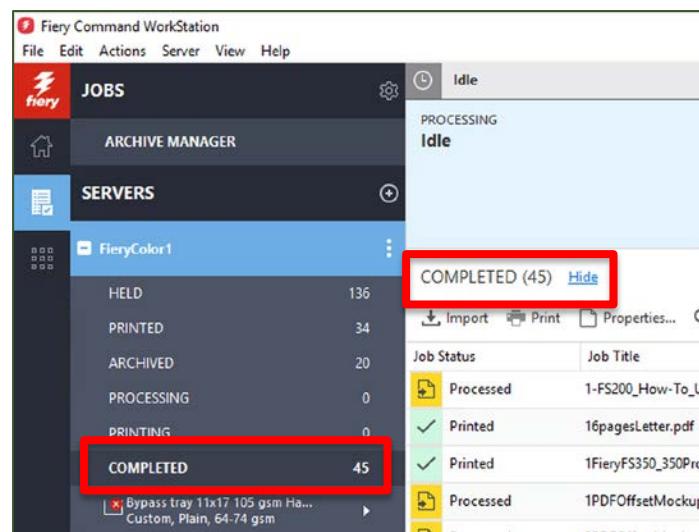

Completed view

A new default view shows all jobs that have been printed, regardless of the location of the job (Held, Printed, Archived).

The COMPLETED view gives users a single list of all jobs printed from the Fiery server, and allows users to better track jobs that printed without causing redundancy or job duplicates in the PRINTED queue.

Users can hide the COMPLETED view by clicking "Hide" in the toolbar above.

This feature is available for all users of Fiery Command WorkStation.

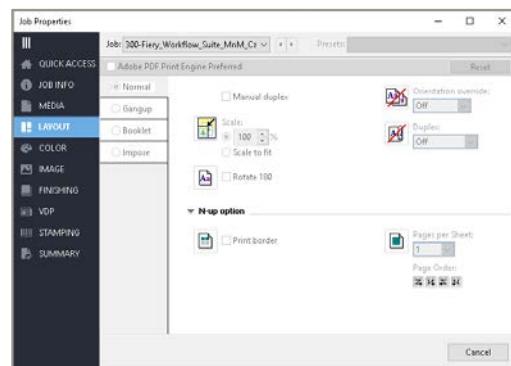

Completed view

Check Properties of active jobs

Fiery users can verify job property settings while a job is waiting, processing, printing or waiting to print. This offers them a chance to check on settings without having to cancel the job first. It is especially useful for jobs imported directly to print.

Since the Job Properties window is for read-only purposes, it presents all settings grayed-out.

This feature is available for cutsheet and high-speed inkjet printers.

Read-only version of Job Properties with all grayed-out settings

Share Command WorkStation settings

Fiery Command WorkStation offers a way to export settings to other Command WorkStation clients connected to the same list of Fiery servers, so that setting up multi-client environments is much faster and ensures a consistent presentation of tools and settings across the print site.

The shared settings are specific to each connected Fiery server and include:

Fiery server list

Job Center: Columns, toolbar, filters, and views

Job Properties: Quick access settings, local presets

Fiery Impose templates

Fiery Image Enhance Visual Editor presets

Access to share settings in Preferences

Shared settings are saved per server and tied to the server name, so settings can't be shared to other Fiery servers of the same model.

This feature is available for all users of Fiery Command WorkStation.

Makeready multi-tasking with Fiery Command WorkStation

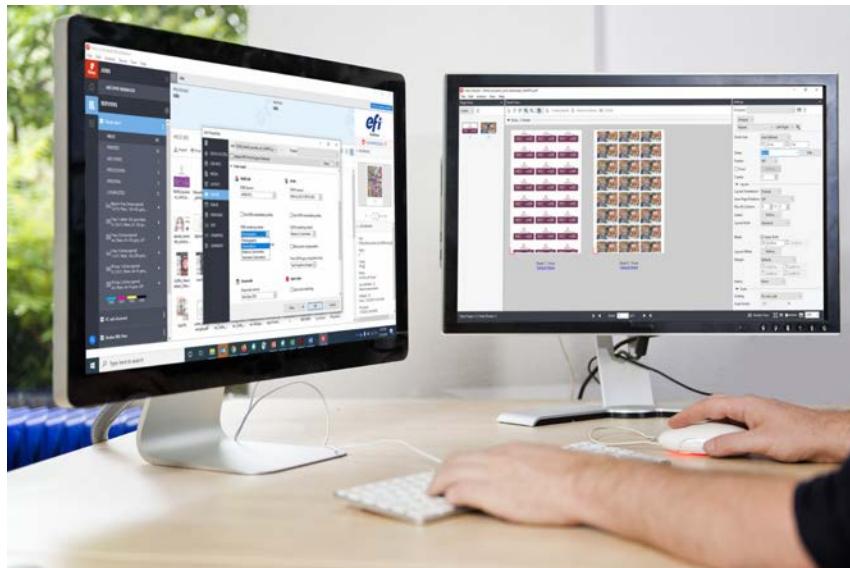

Fiery Impose, Fiery Compose, and Fiery JobMaster, now interact with Fiery Command WorkStation in a more flexible way. The multi-tasking support means that it is possible to work on jobs in Command WorkStation while having another open in either Fiery Impose, Fiery Compose, or Fiery JobMaster.

Fiery FS400 / FS400 Pro print servers – Product guide

In other words, this feature allows you to handle urgent jobs while preparing another that might take longer to prepare.

The Fiery Preview window doesn't provide this multi-tasking functionality. Therefore, this feature is not supported when opening Fiery makeready applications from this window.

This feature is only available for Fiery servers running cutsheet printers.

Multi-tasking while using Fiery makeready applications

Job Properties performance improvement

Opening Job Properties for a job is the most frequently used action in Command WorkStation. Version 6.4 launches Job Properties in 2 seconds or less — at least 3 times faster than before.

Additionally, Job Properties displays the list of output profiles and Fiery ImageViewer curves in alphabetical order.

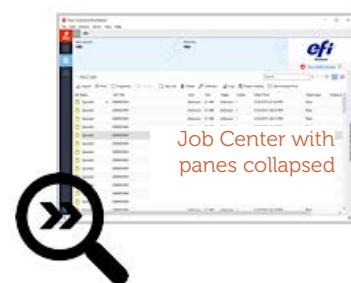

This feature is available for Fiery servers running cutsheet printers.

Mouse scroll-wheel support

Users can navigate and set job parameters faster with full mouse-scroll wheel support including within Job Properties. This feature works within all Command WorkStation windows and is supported in all operating systems that are compatible with Fiery Command WorkStation 6.5.

Collapsible panes

Users can now collapse the Server and Job Summary panes to give more real estate to the Job List area. While panes are collapsed, users can still navigate to different print queues, and see the Fiery Health Monitor. Panes are easily expanded with a single click to the double-arrow icons located in the bottom bar of the Fiery Command WorkStation main window.

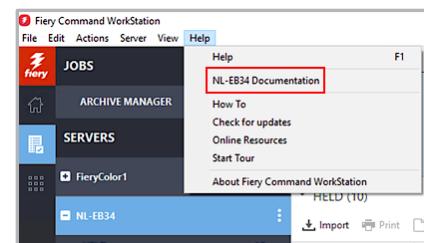

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery-specific help documentation

Users can get direct access to all user manuals for their specific Fiery server type(s) via the Help menu. This online documentation will appear in the Help menu named as per their currently selected Fiery server name and will be automatically displayed in the same language as Fiery Command WorkStation.

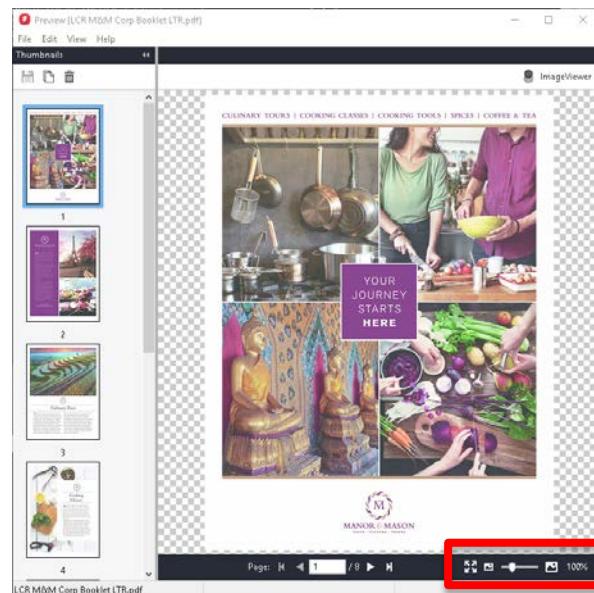

This feature is only available for Fiery servers running cutsheet printers.

Zoom controls in raster preview

When previewing a processed job, the Fiery Preview window presents new controls to zoom the page view in and out from 6% to 400%. There's also a Fit Page button to preview the entire page image in the Preview window.

Fiery-specific online documentation

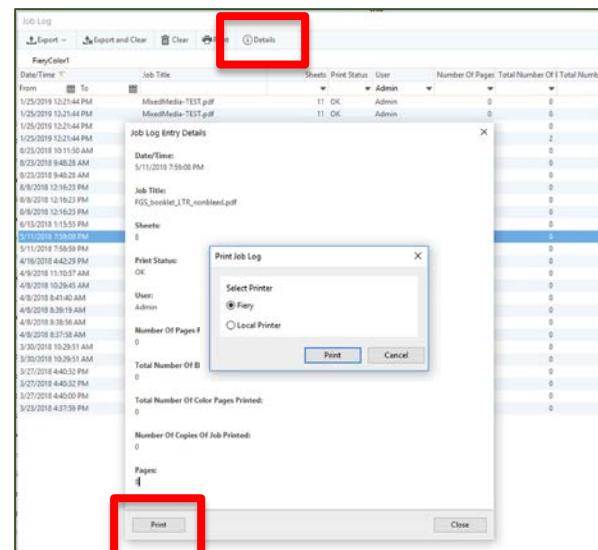

Print job log entry

Fiery users can select a job log entry to display its details in a separate window. This new window offers the option to view and print the first 10 columns of a job log entry. Users can print the information to a local printer, or to the Fiery server, or use CTRL+C to copy the data to other applications.

This feature enables users to see the details of an individual job, especially lengthy details that can't be viewed easily within the job log table format. They can also print these details for use with printed job tickets.

Print job log entry is available for cutsheet and high-speed inkjet printers.

Zoom controls in raster Preview window

Job log details and print option

Manage Fiery Options screen

License activation registration

When activating Fiery software licenses, the Manage Fiery Options screen offers the option to register Fiery software online. The online registration helps users restore lost licenses faster.

In the event a lost license, customers need to contact their usual tech support organisation to escalate the license retrieval to EFI Tech Support.

Fiery FS400 / FS400 Pro print servers – Product guide

Install Command WorkStation independently from Fiery system software

Fiery Command WorkStation software now behaves just like a standard application during installation. Installing the Fiery Command WorkStation Package on a Fiery server is now the same as installing on a remote client. This means that if the Fiery Command WorkStation Package software installed on a Fiery server requires a reinstallation or upgrade, analysts or technicians will not need the System Software DVDs in order to do so.

When you install Fiery Command WorkStation on the Fiery server, the installation will not update the software packages that are shared via WebTools or SMB. Also, the Fiery Service will not be stopped during install, upgrade or uninstall procedure of Fiery Command WorkStation 6.5.

Fiery Ticker

Fiery Ticker is a visual screensaver-type application that runs locally on a Fiery external server that is GUI enabled (also known as FACI enabled) using a monitor, keyboard, and mouse.

Fiery Ticker shows processing and printing speeds, pages remaining for the current job, error messages, and tray information. It is installed as part of the Fiery Command WorkStation Package on external Fiery servers running System 9 and later. Fiery Ticker will run automatically, providing an at-a-glance view of the activity status of Fiery systems when an operator is not directly using the Fiery server. The user can also initiate the Fiery Ticker view directly from the Command WorkStation.

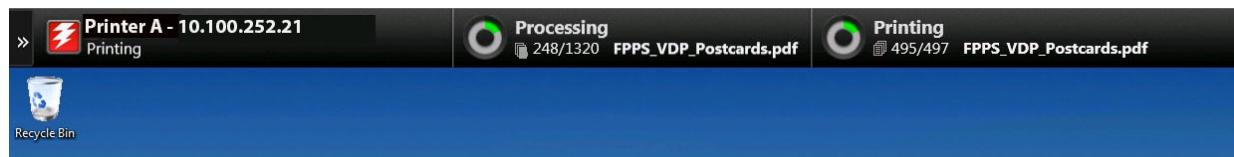

Fiery Ticker progress

Fiery Ticker shows that printing was suspended.

Fiery Ticker integrates with the traditional Fiery blue bar on the top of the screen. There, it also gives users quick access to Fiery applications such as Command WorkStation and Fiery Hot Folders, can change the colour theme; or apply job and server management actions such as to cancel processing or printing, or server actions such as restarting the server.

Fiery Ticker bar showing Fiery server status at a glance

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery Ticker displays shortcuts to key Fiery applications and quick access to job management and server actions.

Benefits:

- Allows production monitoring from a distance, giving users greater flexibility
- Gives users a quick visual look at what the Fiery server is doing, allowing them to perform other tasks at the same time, and boosting productivity
- Increases user productivity, offering quick access to the most frequently used Fiery applications and information

Fiery Go

Fiery Go allows users to monitor and manage Fiery Driven printers from anywhere with their smart phone or tablet. Using Fiery Go, users can perform multiple job actions such as importing, printing, deleting, previewing, and defining job attributes. The app sends alerts about consumable status, errors in the print job, paper jams, and more — so that users can take immediate action.

Fiery Go provides more flexibility and allows staff to multitask for a more efficient workplace and higher productivity. The app is simple to use, takes just minutes to deploy, and is free.

To download Fiery Go and to get additional information, visit Apple iTunes store at <https://itunes.apple.com/us/app/fiery-go/id672206364?ls=1&mkt=8> or Google play store at <https://play.google.com/store/apps/details?id=com.efi.fierygo>

For additional information on technical requirements and a video tour, refer to <http://fiery.efi.com/fierygo>

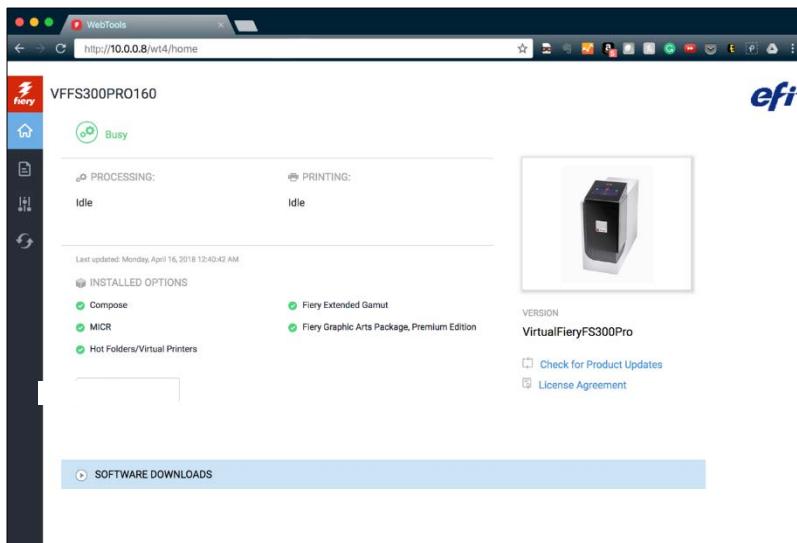

Benefits:

- Allows users to manage the jobs on Fiery servers from anywhere
- Offers the flexibility to multitask for a more efficient workplace

Fiery WebTools

Fiery WebTools™ delivers basic browser-based device monitoring and management for users who don't need the sophistication of Command WorkStation. WebTools is hosted on the Fiery server and can be accessed with any web browser by entering the Fiery server's IP address. It delivers pertinent information on print and printer status at any web-capable client workstation. It also allows users to:

Fiery FS400 / FS400 Pro print servers – Product guide

Download – install print drivers and applications on the client workstation

Access documents – user-authenticated access to jobs in mailboxes, ability to download print jobs to the Fiery server, and basic job management

Configure – allows the administrator to configure the Fiery server

Fiery System Restore – lets users back up a Fiery server for quick recovery later from images stored on the local hard disk, or from a bootable USB drive

Benefits:

Gives administrators and users flexible control, from complex production runs to individual print jobs

Gives access from any client workstation without requiring additional software installation

International support

Language support

Fiery servers running Fiery FS400 and FS400 Pro system software come localized for the following languages: English, French, Italian, German, Spanish, Brazilian Portuguese, Dutch, Russian, Polish, Turkish, Czech, Japanese, traditional Chinese, simplified Chinese, and Korean. Check your Fiery server's datasheet or ask your Fiery vendor for a list of the supported languages.

Dynamic Language Change

The Dynamic Language Change feature allows technicians and administrators to change the Microsoft Windows language on the Fiery server, without having to reload Windows. This feature saves time during the installation and setup process. Administrators and technicians can switch the language using the Fiery Configure application, and the new language is displayed after the Fiery server reboots.

In addition, this feature improves the behavior of Fiery Configure and other related applications in a mixed-language environment. Such environments could include using English Fiery software with systems of non-English client workstations. The handling of double-byte file names is also improved by the addition of UTF-8 support. In Command WorkStation, users can specify language preferences after the installation.

Benefits:

Improves productivity at installation and in the initial setup

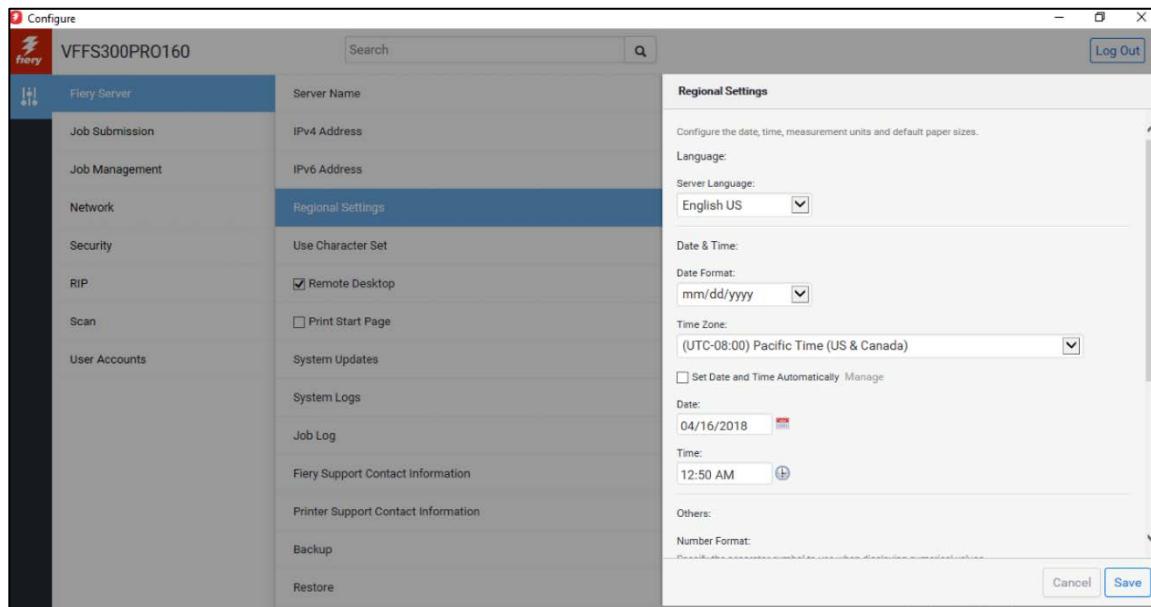

Improves the application behavior in mixed-language environments and the display of double-byte characters in file names, such as those for the Chinese, Japanese, and Korean languages

Improved international support

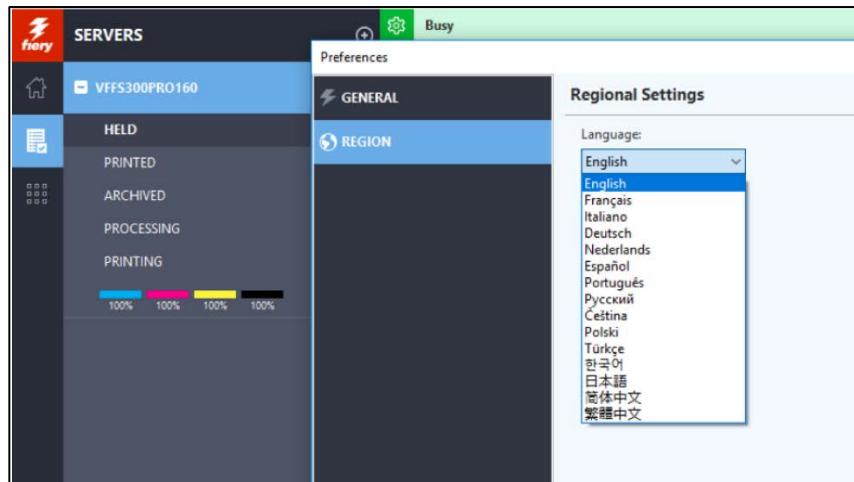

Users can change the language in Command WorkStation and Fiery Hot Folders – independent of the Fiery server. Each user can run Command WorkStation on a client workstation in their preferred language by simply changing it in Preferences.

Fiery FS400 / FS400 Pro print servers – Product guide

The Command WorkStation print job interface can also display the appropriate format for date, numbers, units of measurement, default paper sizes, and colour profiles for European and Asian regions.

Configuring regional settings

Setting language preferences in Command WorkStation

Fiery servers now also recognize double-byte file names. Print providers printing files with double-byte characters, such as those used in Chinese, Korean, Japanese, Hebrew, Turkish, and Russian character sets, will now find their file names preserved correctly in Command WorkStation and in the Job Log.

HELD (13)						
		Search				
		Import	Print	Properties...	Preview...	Impose...
Job Status	Job Title	User	Size	Pages	Copies	^
Spoiled	中国文件名.pdf	Admin	456.1 MB	160	1

Spoiled	Πρέπει να φανείτε ENTAΞΕΙ.pdf	Admin	456.1 MB	160	1	

Double-byte file names on Command WorkStation

Benefits:

Displays regional paper sizes and dates for a more user-friendly experience

Speeds up first-time language setup of server and Command WorkStation client workstation

Fiery FS400 / FS400 Pro print servers – Product guide

Provides flexibility to use Command WorkStation in the user's preferred language, regardless of the Fiery server language

Improves usability in double-byte font environments

Global Units

Global Units adds a new item to the Command WorkStation preferences, allowing the user to specify preferred units of measure as millimeters, inches, or points.

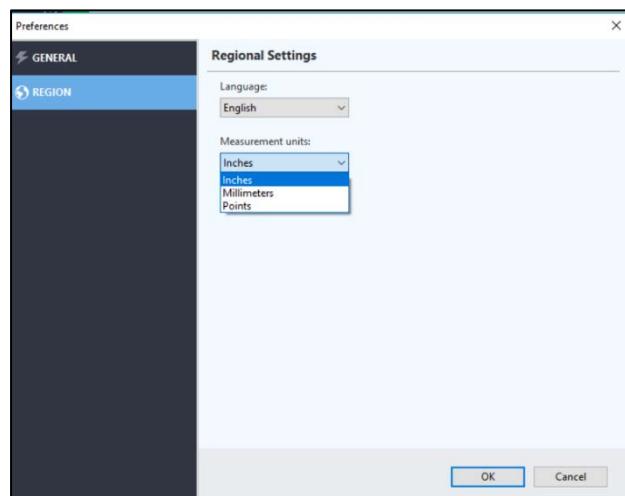

This setting then influences the default units displayed for all purchased software products in the Job Properties and Command WorkStation 6 user interface. Users can still override the selection inside Job Properties if they wish to specify a value in a different measurement unit. This feature also enforces consistency across unit boxes. For example, each control presents two integers and two decimal places, such as "12.05."

Each connected Command WorkStation client could have different settings.

The areas affected by the Units preference include:

Job Properties – all items that allow a measurement unit to be specified

- Image shift
- Custom page sizes
- Margins
- Trim
- Booklet Maker
- Impose
- JobMaster
- Compose
- Paper Catalog
- Tray alignment

Global Units preference setting in Command WorkStation

Benefit:

Allows users to set their measurement preference in one place and have it reflected across their whole user experience

Advanced job management

A successful production printing operation depends on a very structured workflow, much like a factory assembly line; each step is dependent on the successful completion of the last. The Fiery system has many tools that manage jobs faster and minimize bottlenecks. A truly integrated solution, it also uses these features to give production print operators tremendous flexibility to alter aspects of the workflow without disruption:

- Force Print
- Suspend on Mismatch
- Rush Print
- Print/Process Next
- Quick Doc Merge
- Sample Print
- Schedule Print
- Proof Print
- Modify Default Queues
- Increased maximum number of jobs in printed queue

Force Print

If the paper attributes of the job do not match what is in the printer, the user can force the job to print using what's currently loaded in the printer, regardless of the job's status in the Print queue.

This feature is available through Command WorkStation if the connected server has Force Print enabled, and it allows the user to do the following:

- Force the job to print to any tray available at that time, while the job is in the Print queue.
- Print RIPped files without re-RIPping or canceling the job first. If the new tray media is a different size, the resulting output may be cropped. Also, if the new tray uses a different colour profile, the job will be printed with the original tray's colour profile.
- Use any tray (except bypass trays) with any paper size, media type, weight, or coating supported by the printer.

Benefits:

Saves time by printing the job immediately when holding a hard-copy version of the job is more important than making sure the job is perfect

Can eliminate the need to resubmit jobs to the printer when there is no need to re-RIP the file

Suspend on Mismatch

To ensure faster throughput and the highest quality, users can use Suspend on Mismatch to hold jobs when they have missing resources or a colour profile mismatch. Until the user corrects the problem or applies Force Print to the job, it remains suspended and other jobs in the server will continue to print.

Benefits:

Prevents one job from holding up all the other jobs that could be printing

Avoids outages on the production line, and decreases bottlenecks at the RIPping stage

Rush Print

The Rush Print feature provides advanced job management that allows the user to mark the job as urgent, process and print it immediately, and interrupt the currently printing job. The utility will apply a logical interruption to the job currently printing, either at the end of a set, or after 30 pages — whichever occurs first. Then, as soon as the Rush Print job finishes, the interrupted job will resume printing where it left off.

Fiery FS400 / FS400 Pro print servers – Product guide

Benefits:

Increases the flexibility to re-prioritize and introduce last-minute changes in the processing and print stages

Eliminates the need to stop and restart production when one job needs to be printed right away

Prevents waste by allowing a job to be paused during printing, and then resumed and finished later, instead of requiring that the user cancel and discard the previously printed portion of the job

Print/Process Next

Print/Process Next lets users pick the next job to process or print. It gives them the ability to make a job print or process immediately, following the completion of the job currently printing or processing. Depending on the engine behavior, the Fiery server may only be able to advance a job to Print Next ahead of other jobs currently processing.

Benefit:

Gives the user a way to change the printing order of jobs based on last-minute, urgent demands

Quick Doc Merge

Quick Doc Merge allows the user to quickly merge documents by combining them in a new job. The documents can be on the Fiery server or be imported from a browsable directory, separate from the Fiery server's job list. The system can also finish the entire job all together or apply the job's finishing options to each of the merged documents. Once documents are merged into a new job, the job will remain intact — even if some of the source documents are deleted from the held queue.

Benefits:

Saves user time by eliminating the need to merge PDF files before print submission

Gives users the flexibility to combine multiple jobs, without needing to open the file and manually merge pages

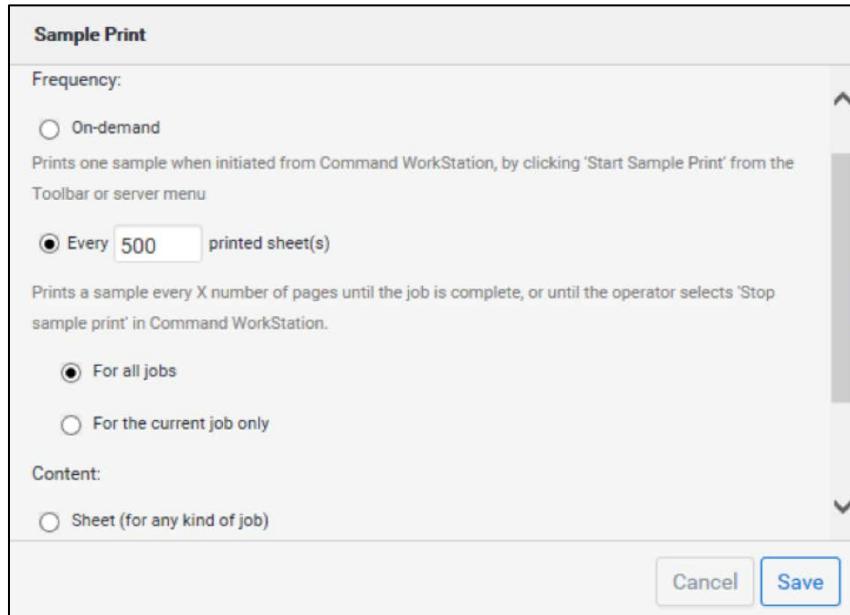

Sample Print

The Sample Print feature allows the user to monitor engine output quality while the engine is in full production, and print extra pages to an easily accessible output tray during a long print job. This way, they can verify that the engine is performing as expected. If the output is unsatisfactory, the user can take corrective action. While a job is printing, the user can initiate a sample print from Command WorkStation using the Start Sample Print option under the Server menu.

This feature is most useful for engines with multiple output trays, and when one of the output trays is closed and not easy to access during printing — such as in a stacker unit.

The user can also configure the Fiery server to print sample prints at a predefined interval. This lets the user print sample pages on a regular basis, either as a regular spot check, or as part of a process to create an archive of printed sheets to document the print quality at regular intervals.

Fiery FS400 / FS400 Pro print servers – Product guide

Configure Sample Print to meet workflow needs.

The user can print an extra sheet (or output set):

On demand by selecting the Sample Print button from Command WorkStation

Every preset number of sheets, the user can instruct the Fiery server to stop printing sample pages once the current job is done, or to continue printing sample pages for all jobs until the user manually stops the Sample Print function

Benefits:

Performs quality control of the output while the engine is printing, avoiding production halts, ensuring quality of the output, and increasing overall productivity

Makes it easy for users to take corrective actions before the job finishes printing, minimizing waste and reducing clicks

Schedule Print

Schedule Print is an advanced job-management tool that allows the user to define when jobs will print by setting DATE/TIME parameters. The jobs will print as soon as the DATE/TIME conditions are met, the server is turned on, and the print engine is available.

Benefits:

Increases automation of the production process, allowing for unattended printing, and eliminating the need to have attendants constantly on watch — thereby reducing overhead costs

Provides the ability to plan the processing and printing stages in advance

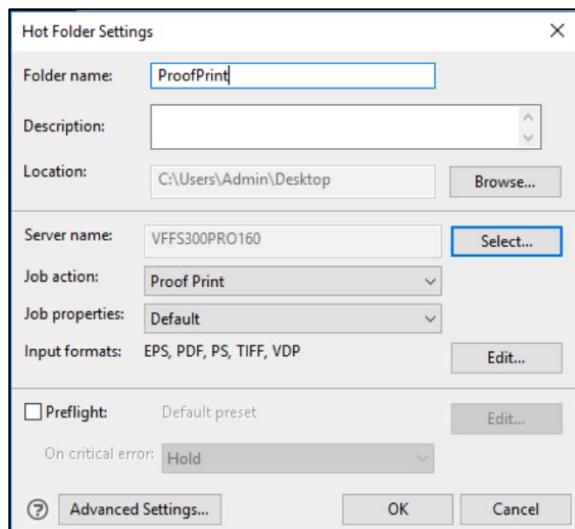

Facilitates balancing the workload and prioritizing print production throughout the day to avoid peaks and bottlenecks

Allows advance scheduling of batch jobs. For example, if there are jobs with the same media characteristics, the users can schedule the jobs to print when the media is loaded in the printer

Proof Print

Proof Print allows users to produce a copy of any job in the Hold or Print queues with a single mouse click. This eliminates the need to open the job in Job Properties, modify the job ticket, or change the copy count to print a copy for proofing.

Fiery FS400 / FS400 Pro print servers – Product guide

Request Proof Print from Fiery Hot Folders.

Targeted to Command WorkStation users, the Proof Print feature is particularly powerful in the Fiery Hot Folders workflow because Proof Print can be selected as a Job Action when setting up Hot Folders. After the system produces the Proof Print, the job moves into the Hold queue until it is released to print the full copy count.

Increased maximum number of jobs in Printed queue

The maximum number of jobs stored in the Printed queue has been increased for easier and faster access to jobs for reprint. The maximum number of jobs varies between embedded and external servers:

Fiery embedded servers running FS200 and above software will store up to 1,000 jobs

Fiery external servers running FS200 Pro and above software can now store as many as 2,000 jobs

The default number of saved jobs is 10, but can be modified using Fiery Configure and Fiery WebTools.

Once the number of stored jobs reaches the number defined above, the Fiery server starts deleting the jobs in first-in, first-out order.

Benefit:

Easier and faster access of jobs to reprint

Printed Queue	
<input checked="" type="checkbox"/> RIP while Receive	Saves recently printed jobs for quick reprinting.
<input type="checkbox"/> Preview while processing	<input checked="" type="checkbox"/> Save printed jobs
Job Mismatch	Jobs saved in printed queue:
Sample Print	10 (1-2000)

The default number of saved jobs is 10, and can be modified by the administrator.

Fiery Automation Package

The Fiery Automation Package is a new Fiery software product for embedded Fiery servers running FS400 software and above. It provides more convenient access to automation and advanced job management functions than the Fiery Productivity Package. Fiery Productivity Package is no longer offered for Fiery FS400 servers.

The package includes the following features:

Fiery Hot Folders: Automates the job submission process, reducing errors, and speeding repetitive tasks with a simple drag-and-drop operation. Input formats are: PS, PDF, EPS, DOC, DOCX, XLS, XLSX, PPT, PPTX, PPS, PPSX, and PUB.

Virtual Printers: Streamlines job setup times and eliminates print errors on repetitive print jobs by using predefined job settings in the print driver.

Filters for hot folders: EPS, JPEG, TIFF, TIFF1-bit TIFF (engine specific), PDF/X compliance

Fiery FS400 / FS400 Pro print servers – Product guide

Rush Print: Marks a print job as urgent so it can be processed and printed immediately, even interrupting a job that is printing.

Schedule Printing: Balances workload, prioritizes print production, and eliminates bottlenecks

Print/Process Next: Queues a job to print immediately after the currently running print job completes.

Fiery Preflight: Checks jobs for problems before they are printed. This feature can be automated through a Fiery Hot Folder workflow or with Fiery JobFlow. Preflight catches problems before they result in bad prints that must be reprinted to satisfy the print buyer.

Fiery JobFlow Base: Automates job preparation steps in prepress workflows to produce ready-to-print files.

Fiery JDF: Provides built-in JDF-based integration support to automate processes from job submission to output by integrating print workflows and business management systems so that job information can flow through the systems with fewer touchpoints and errors.

The Fiery Automation Package is available as a term-based license that can range from 1 to 5 years, starting on the date of activation.

Fiery Workflow Suite: Prepress solutions

Fiery Workflow Suite includes all the prepress tools necessary to prepare a job for printing in a production environment. Fiery servers offer makeready components with Fiery Impose, Fiery JobMaster, and Fiery Compose. Those software applications are covered in the [Fiery makeready section in this product guide](#). Fiery servers offer advanced prepress tools to address colour control, troubleshooting, and automation of labour-intensive prepress processes. Those advanced tools are included in the Fiery Graphic Arts Pro Package, Fiery ColorRight Package, Fiery Automation Package, and Fiery JobFlow.

Fiery prepress tools offer printer providers a flexible solution that can be available to either the local press operators or the remote prepress specialist without the need to invest in a dedicated desktop client. The unified working space for all prepress tasks simplifies labour-intensive, job-preparation activities and shortens job setup times of even the most complex jobs.

Fiery Graphic Arts Pro Package

Be confident that output will print right, every time. Fiery Graphic Arts Pro Package replaces the Fiery Graphic Arts Package, Premium Edition to provide FS400 Pro users with the ultimate toolset that helps reduce wasted prints and minimizes job rework.

Features in Fiery Graphic Arts Pro Package include:

1. **Fiery Preflight** – Checks jobs for problems before they are printed. This feature can be automated through a Fiery Hot Folder workflow or with Fiery JobFlow. Preflight catches problems before they result in bad prints that must be reprinted to satisfy the print buyer.
2. **Fiery ImageViewer** – Allows the user to visually inspect the raster output before printing, and to apply colour adjustments for the overall job if needed. Because Fiery ImageViewer supports soft proofing, users can achieve colour-accurate visual corrections on a properly calibrated and profiled display.
3. **Fiery Postflight** – Lets users troubleshoot problem jobs by identifying types of content, reporting missing spot colours, and printing test pages to confirm whether an imaging problem is in the file or with the printer hardware.
4. **Fiery Spot Pro** – Provides powerful spot colour management tools to ensure consistent, accurate brand colour reproduction.
5. **Fiery Control Bar** – Adds dynamic job information and user-selected colour bars to each printed page, including the Ugra/Fogra Media Wedge or Idealliance colour bars

Fiery Graphic Arts Pro Package is available as a term-based license that can range from 1 to 5 years, starting on the date of activation.

Fiery ColorRight Package

The Fiery ColorRight Package provides more convenient access to colour and image-quality functions for Fiery embedded servers. Many of these features were previously part of the Fiery Productivity Package which is no longer offered for Fiery FS400 servers.

Features in the Fiery ColorRight Package include:

Fiery Spot Pro: Integrated tools to easily manage and edit spot colour libraries, ensure conformity to colour standards, and utilize tools for seamless collaboration with designers

Fiery ImageViewer: Provides fast local and remote softproofing tools for amazing preview and colour editing capabilities in Fiery Command WorkStation.

Fiery Image Enhance Visual Editor: Interactive toolset for optimizing image appearance. Adjusts brightness, contrast, highlights, shadows, colour balance, and sharpness; and makes red-eye corrections on any image.

Fiery FS400 / FS400 Pro print servers – Product guide

Control Bar: Delivers effective colour quality control, consistent results, and job identification on every printed page by applying customized job information and images including logos, company names, or colour bars.

Postflight Report: Job diagnostic tool delivers colour-coded reports to quickly and easily identify potential printing issues such as mixed-source colours and missing spot colours.

The Fiery ColorRight Package is available as a term-based license that can range from 1 to 5 years, starting on the date of license activation.

Fiery Automation Package

The Fiery Automation Package is a new Fiery software product for embedded Fiery servers running FS400 software and above. It provides more convenient access to automation and advanced job management functions than the Fiery Productivity Package. Fiery Productivity Package is no longer offered for Fiery FS400 servers.

The package includes the following features:

Fiery Hot Folders: Automates the job submission process, reducing errors, and speeding repetitive tasks with a simple drag-and-drop operation. Input formats are: PS, PDF, EPS, DOC, DOCX, XLS, XLSX, PPT, PPTX, PPS, PPSX, and PUB.

Virtual Printers: Streamlines job setup times and eliminates print errors on repetitive print jobs by using predefined job settings in the print driver.

Filters for hot folders: EPS, JPEG, TIFF, TIFF1-bit TIFF (engine specific), PDF/X compliance

Rush Print: Marks a print job as urgent so it can be processed and printed immediately, even interrupting a job that is printing.

Schedule Printing: Balances workload, prioritizes print production, and eliminates bottlenecks

Print/Process Next: Queues a job to print immediately after the currently running print job completes.

Fiery Preflight: Checks jobs for problems before they are printed. This feature can be automated through a Fiery Hot Folder workflow or with Fiery JobFlow. Preflight catches problems before they result in bad prints that must be reprinted to satisfy the print buyer.

Fiery JobFlow Base: Automates job preparation steps in prepress workflows to produce ready-to-print files.

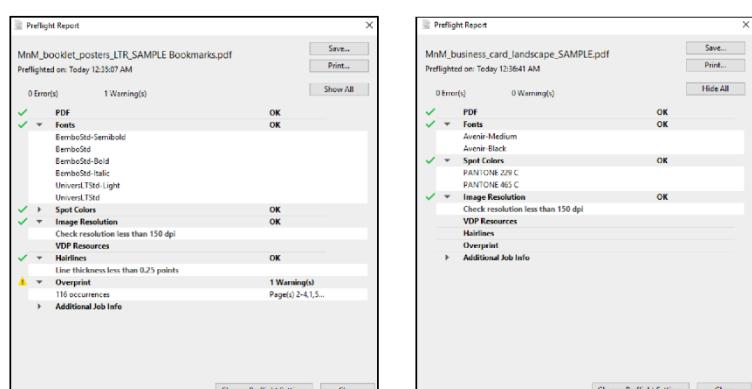

Fiery JDF: Provides built-in JDF-based integration support to automate processes from job submission to output by integrating print workflows and business management systems so that job information can flow through the systems with fewer touchpoints and errors.

The Fiery Automation Package is available as a term-based license that can range from 1 to 5 years, starting on the date of activation.

Preflight

Eliminating errors before they happen and making sure all settings and systems perform correctly is an integral part of managing a successful production printing operation.

Interrupting a job to make corrections wastes valuable time and resources, and it takes much more time to correct a problem once production has started. For these reasons, prepress specialists and operators prefer to “preflight,” a job before submitting it straight to production.

Fiery FS400 / FS400 Pro print servers – Product guide

In print production, preflighting involves checking a file for its "print worthiness." Several tests are performed, and settings are verified on the file to [Examples of Preflight report results](#) determine whether it will print successfully.

Specially created for digital colour printing, Fiery Preflight is a powerful preflight tool designed to check the most common areas of error to ensure that files will print successfully on a Fiery Driven printing device.

Preflight is a fast process that does not affect the performance of the Fiery server because it is performed outside of the actual job printing. The Preflight report is displayed in a matter of seconds. In reviewing the report, the user knows at a glance whether there are errors or missing elements in the job and can easily verify the status of every checked area. Users can access Preflight from the Command WorkStation.

Preflight reports on a number of elements, including:

- Fonts
- Spot colours
- Low-resolution files
- VDP resources
- Hairlines below threshold
- Overprint
- PostScript errors
- Additional information
 - o PDF document security
 - o Page size(s) and page boxes (such as trim, media, crop, etc.)
 - o Colour spaces
 - o Flatness

Fiery FS400 / FS400 Pro print servers – Product guide

Preflight component	What it checks	Default error level
Fonts	Reports if font not found on server	Critical
	Reports if Courier font is present. The presence of Courier font usually means that a font not found has been automatically replaced by a system default font.	Information
Spot colours	Reports if spot colours are not found in Spot-On libraries	Critical
Low-res images	Reports if image resolution is less than a specified DPI	Warning
VDP resources	Reports if VDP resources are not found	Critical
	Preflights individual VDP resources (using same checks applied to entire job)	Off
Hairlines	Reports if line width is less than a specified point value	Warning
Overprint	Reports when overprint is detected	Warning
PostScript errors	Reports if job results in a PostScript error (Preflight immediately aborts in this situation.)	Critical
Halt Preflight when first error found	Any error found (This is a checkbox option; it is either ON or OFF.)	Off

Table: Elements reported by Preflight

Benefits:

Eliminates the need for users to purchase third-party applications to perform preflight testing. Preflights VDP jobs to ensure proper availability of VDP resources

Increases productivity in job-submission and print processes by eliminating printing errors at the printing stage, reducing waste due to missing resources.

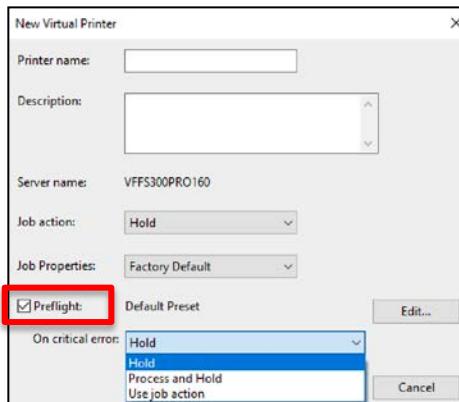

Improves communications with designers by using the preflight report to improve the quality of the jobs submitted to the Fiery server, reducing turnaround time.

Fiery Preflight for Hot Folders, Virtual Printers and Fiery JobFlow

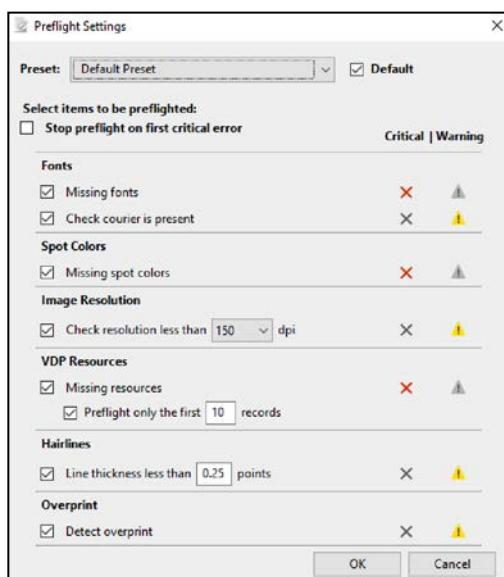

Fiery users can apply Preflight to any jobs that use Hot Folders and Virtual Printers to automatically check files before processing. Automatically preflighting jobs saves time, resources and money, and it increases productivity by rerouting incorrect files before printing.

Users can configure Fiery Preflight when setting up Hot Folders and Virtual Printers by checking the Preflight box and specifying a Preflight preset. The administrator can define what constitutes a warning or error and what to do with jobs that have these errors. For example, jobs can be moved to the Hold queue — preventing them from printing and wasting materials.

Fiery FS400 / FS400 Pro print servers – Product guide

Enable Auto Preflight when setting up Hot Folders and Virtual Printers.

Customize the warning error tolerances in Preflight settings.

Benefits:

Automatically preflighting jobs saves time and increases productivity.

Rerouting incorrect files before printing saves resources and money.

Fiery ImageViewer

When considering the overall cost associated with producing printed materials, many print providers focus on the final "cost per page" for ink or toner on paper, according to the CAP Ventures study – *The Cost of Business Communication: A Look at the Business Document Lifecycle*. Actually, the real cost of producing printed materials includes the time and resources allocated to print production. These expenses include authoring, design, proofing, revision control, ordering, warehousing, distribution, and obsolescence.

The CAPV study finds that internal preparation and review of print jobs accounts for at least 15% of the real costs of production. Obsolescence or waste adds another 14% to the overall cost. It's now easy to understand why accurate proofing and review of documents remains critical to reducing costs and increasing profits for print providers.

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery ImageViewer features the most powerful collection of preparation and review tools ever integrated into a colour DFE. It provides:

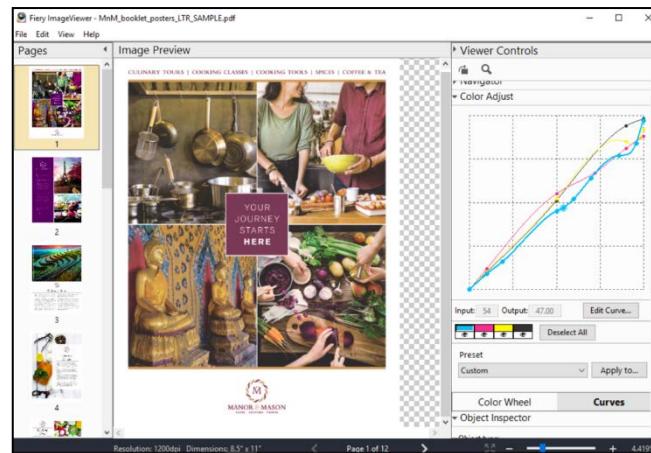

- Local and remote soft proofing
- Online and offline soft proofing
- Intuitive colour-editing capabilities for viewing and correction of a job after RIPping – but before it is sent to the print engine.
- Resources to view the effects of trapping, troubleshoot imaging artifacts, and make late-stage colour adjustments

Key functions and features include:

- Adjusts colour on a per-page basis or in a selected area of the page
- Applies colour modifications to that particular job and prints it without the need to re-RIP the job
- View individual separation of a job
- Generates soft proof PDF and exports a low-resolution raster file in PDF format for offline proofing
- Provides powerful and instantaneous zoom all the way to the pixel level
- Previews jobs without wasted clicks

Benefits:

- Saves time and money by allowing visual review of all elements in a file before sending it to the output device
- Offers late-stage colour editing before printing
- Reduces waste, increases productivity, and adds flexibility to the workflow
- Avoids unnecessary proof prints
- Permits rework without re-RIPping the job, saving valuable production time

Fiery ImageViewer user interface

Fiery ImageViewer new features

The following features are only applicable to Fiery servers driving full-colour print engines.

Colour replacement

With ImageViewer colour replacement, users can replace up to 5 specific colour tints in an output raster. This enables users to perform late-stage colour replacements without needing to go back to the original file or using the Substitute Colours feature in Fiery Spot-On™. With it, users can:

Replace colour on any object type (text, graphics, spot colours, images, and smooth shades). Colour replacements are global and apply to any instance of the original colour throughout the job.

Enter specific CMYK replacement values (if known) or sample another tint in the raster to use as the replacement colour – no need to know original colour values.

Re-order colour replacements. As colour replacements happen sequentially, users may desire changing the order of the replacements and have better control of how a colour change may affect previous colour replacements.

Use it with CMYK, RGB, CMYK+, specialty colours (such as clear or white), and grayscale.

Save colour replacements as a preset alone or along with a curve adjustment, then apply via Job Properties in Command WorkStation, Fiery driver, or Hot Folders/Virtual Printers.

Fiery FS400 / FS400 Pro print servers – Product guide

Color replacement options in Fiery ImageViewer

Color replacement example

Fiery ImageViewer includes local colour replacement for FS400/FS400 Pro servers. With local colour replacement, the replacement only applies to a user-specified area (though it can be applied to other areas of the page or throughout the document, if desired).

Key benefits include:

Edit colour in a selected page area without going back to the design file or to prepress

Replace colour in a selected area without affecting that colour's appearance in other areas

Sample colour from other page areas or enter replacement colours manually

- o Use with CMYK, CMYK+, specialty colours, or grayscale

Example:

Fiery FS400 / FS400 Pro print servers – Product guide

Scenario: customer wants to change the last 2 stars in this logo from blue to green – without affecting the other green areas in the logo

Simply select the area where the color needs to be replaced using the Local Correction option and define the original and replacement colors

The desired area will be changed without affecting any other areas

Local colour curves

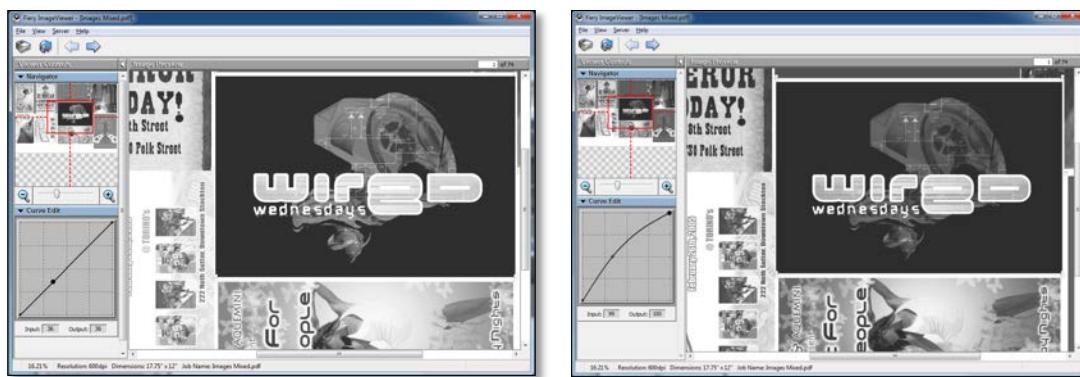

Similar to local colour replacement, users of Fiery Graphic Arts Pro Package or Fiery ColorRight Package can choose to adjust colour curves in a selected area of the page.

Fiery ImageViewer for Black and White

This is an optional plug-in to the Fiery Command WorkStation application for Fiery servers driving black-and-white engines. It allows users to preview full-resolution print data so they can see exactly how a black-and-white job will look before they print it — saving time, plus reducing waste and mistakes.

It also provides controls to adjust the black tone curve, and lets users copy the same tone curve to other jobs or similarly equipped print engines. This way, print providers can split long runs between multiple engines with consistent output.

Also, print providers can match the output to a customer's satisfaction, and they can store and edit, or reload black tone curves over time to guarantee consistent delivery of print results and accommodate changing print requirements.

Benefits:

Full-resolution previews allow users to review the content and check for missing fonts or images, PostScript errors, and layout issues without the need to print the job — saving clicks and minimizing waste.

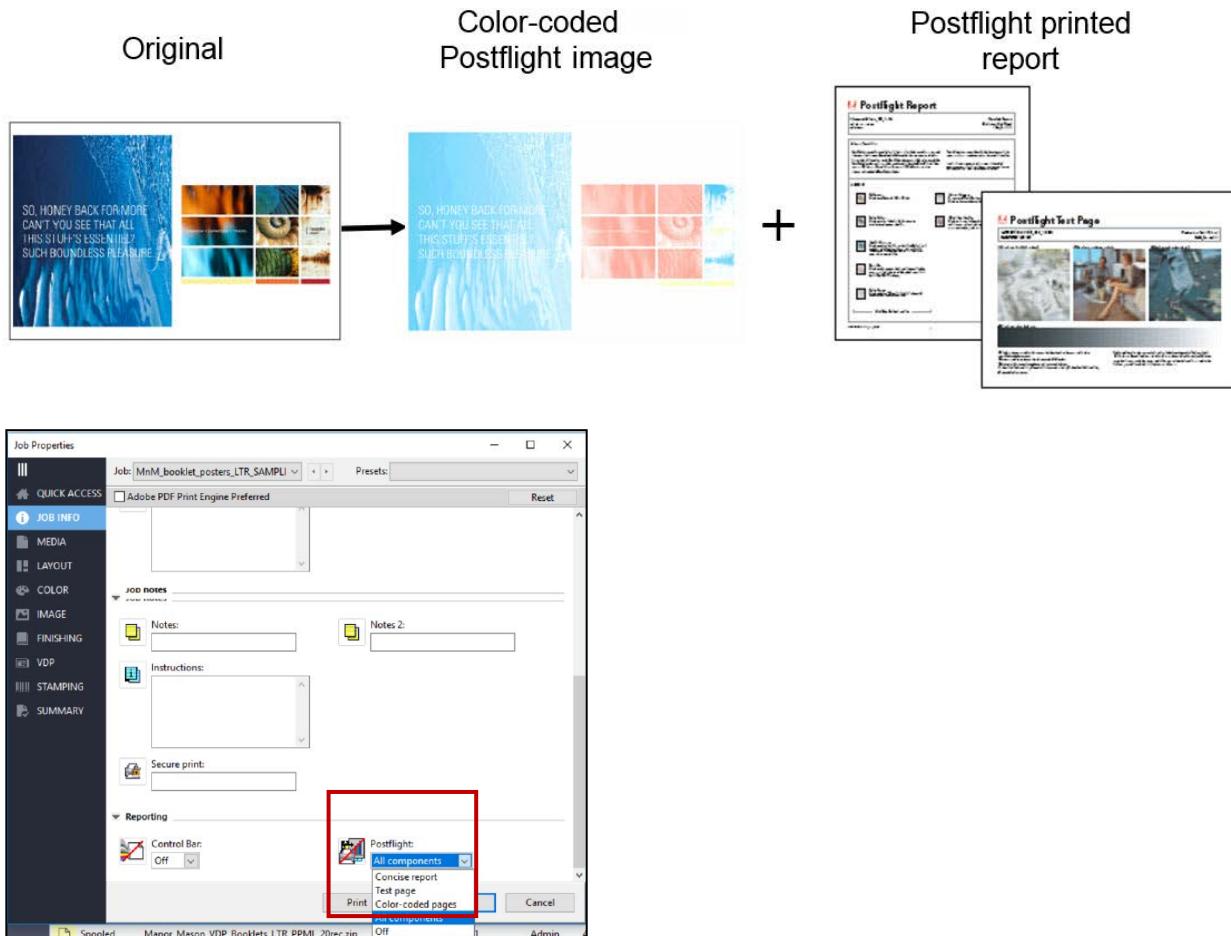

Black tone curve adjustments can be saved and applied to other jobs or other Fiery Driven black-and-white engines to ensure output consistency at all times.

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery Postflight

Fiery Postflight is the process of analyzing processed files for quality control in a digital prepress workflow. The Fiery Postflight report lets users produce a colour-coded version of the job to indicate the source colour space of each element for colour print troubleshooting. The colour coding is explained in an appended report that describes which colour spaces are used in the job and what job options affect those spaces. The report also provides information about the print environment, such as calibration date and time, as well as calibration method. Users may also print a colour test page to verify the condition of the print engine.

Users can easily choose to produce Postflight reports from the Fiery driver.

Select Postflight from the Job Info tab in Job Properties and Fiery driver

Benefits:

Decreases the amount of time a user has to spend troubleshooting jobs, increasing efficiency, reducing turnaround time, and maximizing profitability

Reduces the learning curve by teaching users the effects of job-setting parameters, making it useful as a training tool

APPE Postflight report

APPE Postflight reports the source colour spaces in a PDF that are sent to APPE for processing. APPE postflight also improves the reporting of missing spot colours by colour-coding spot colours found in Fiery Spot-On differently than the missing spots.

This feature only works on Fiery external servers running FS200 Pro and above. Users need to enable APPE in Fiery Configure. To do this:

Check Use Adobe PDF Print Engine Preferred as default for PDF Jobs

Or check the Adobe PDF Print Engine Preferred selection in Job Properties

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery Spot Pro

Companies know that protecting their brand colours is key to maintaining their corporate identity. With Fiery Spot Pro, part of Fiery Graphic Arts Pro Package and Fiery ColorRight Package, end customers can be confident that their brand colours are reproduced correctly, every time. Integrated tools allow users to easily manage and edit spot colour libraries, ensure conformity to colour standards, and seamlessly collaborate with designers.

Benefits:

Work seamlessly with designers to ensure brand colour consistency

- Export/import libraries in Adobe Swatch Exchange (.ase) or Colour Exchange Format (.cxf) to enable designers to work with the actual named colours on the Fiery server
- Simplify spot colour management in a production workflow by using a spot colour alias

Simplify spot colour management

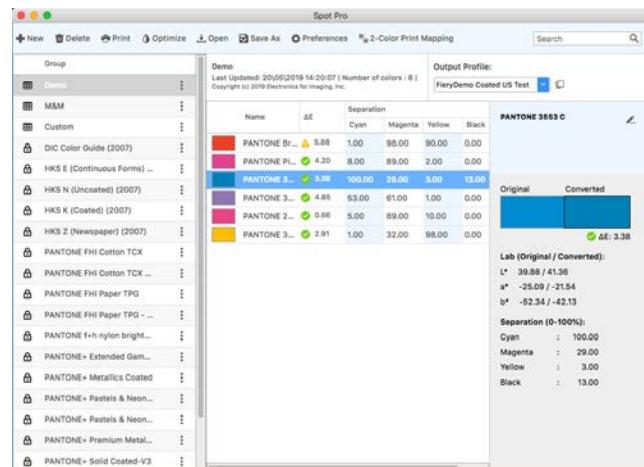

- Quickly and easily create spot colour groups
- Edit spot colours for multiple profiles simultaneously
- Get improved search across all spot colour libraries
- Easily launch Spot Pro from the Command WorkStation Job Center
- Create custom swatch books to fit a desired page size

Use powerful tools to customize spot colours

- Edit in device-independent colour space (L^*a^*b , L^*c^*h)
- Optimize spot colours using a spectrophotometer (no Fiery Color Profiler Suite license required)
- Edit spot colour tints

Easily conform to industry standards

- View gamut warnings across colour libraries
- Customize Delta E tolerance and format to desired standards

Fiery Spot Pro main interface

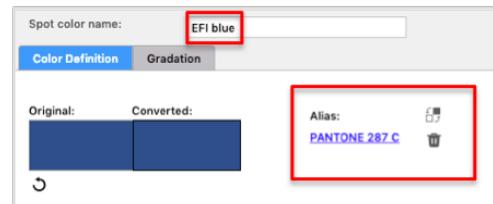

To see how Fiery Spot Pro compares to Fiery Spot-On™, please view the detailed [comparison](#).

In addition to the features above, Fiery Spot Pro includes these features exclusively for FS400/FS400 Pro servers:

Spot colour alias

Users can create an alias that maps one named spot colour to another named spot colour. This provides enhanced functionality compared to the Substitute Colours feature, which maps CMYK or RGB values to a spot colour.

In the example to the right, a spot colour named "EFI blue" can be mapped to PANTONE 287 C.

Fiery FS400 / FS400 Pro print servers – Product guide

Benefits:

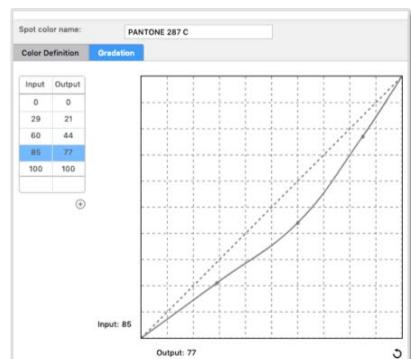

- Ensures spot colour consistency from design to print — designers can use simple named colours, and the print service provider can create an alias to map those named colours to the correct spot colour value
- Edits to specific spot colours are mapped to any corresponding alias colours

Spot colour gradation editing

Users can now edit a non-solid reproduction of a spot colour.

Benefits:

- Delivers finer control over spot colour reproduction, including managing blends with spot colours, which is very important to brand owners
- Allows users to manually make the gradation darker or lighter

Control bar

A colour control bar is commonly used on conventional press work and contract proofs. Without a colour bar, it is difficult to determine the colour precision of the print.

Control bar displayed at side of page

The control bar also adds dynamic job information. Users select colour bars for each printed page, and can customize the printed information by entering settings/preferences into the fields provided in the user interface. They can also save these settings for future use.

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery Control Bar Builder

Fiery Control Bar Builder has a visual interface to design custom control bars. This allows for different colour bars or job information, depending on the print application. Each custom control bar can be used across all media sizes, reducing setup time and simplifying the ability to use custom control bars.

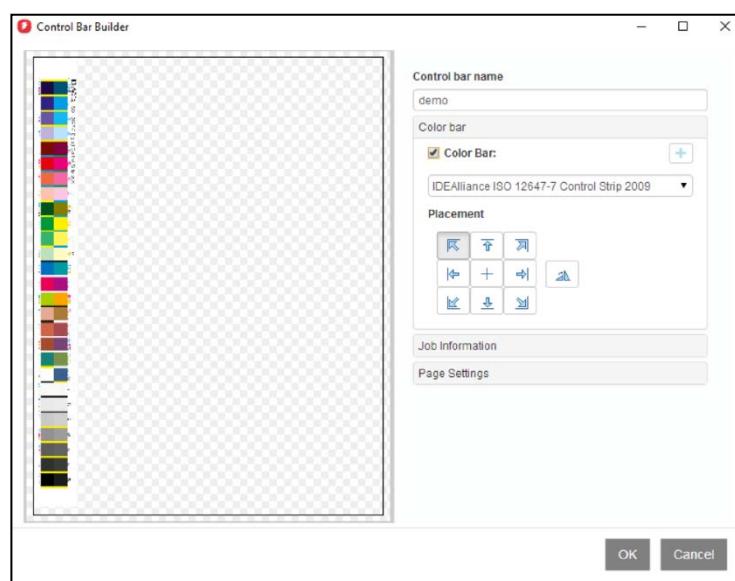

Users can upload a custom colour control bar, or use an industry-standard colour bar such as the Ugra Fogra or Idealliance control wedge included with Control Bar Builder.

They can customize font, text size, colour, and the order of information in the job ticket portion. And place the control bar vertically or horizontally on the sheet, and in different locations. The Fiery driver and Job Properties provide a selection of default and custom control bars created with the Control Bar Builder.

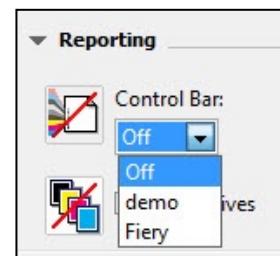

Benefits:

Flexibility of control bar placement and content that works across media sizes

Users can design custom control bars for colour consistency and quality control of specific jobs

Control Bar Builder user interface

Control Bar selection in Job Properties and Fiery driver

New standard colour and imaging features

The following features, previously available in the optional Fiery Graphic Arts Package, Premium Edition and Fiery Productivity Package, are now included as standard for all Fiery FS400/FS400 Pro servers.

Fiery Spot-On

- o Standard for all platforms except Fiery A series

Halftone simulation with frequency per colour

Configurable auto trapping

Paper simulation with white-point editing

Two-colour print mapping

Hot folder filters: JPEG, TIFF, EPS, 1-bit TIFF

- o Standard for external servers only

Halftone simulation – with frequency per colour

When final document printing is done on an offset press, operators may want to simulate the final halftone screen that will be used to generate conventional films or plates.

The Halftone Simulation feature allows users to print simulated halftone dots, and to define the custom screening parameters that will be applied to their print jobs.

Halftone Simulation includes three halftone screen parameters:

Fiery FS400 / FS400 Pro print servers – Product guide

Lines per inch for each colour

Screen angles for each colour

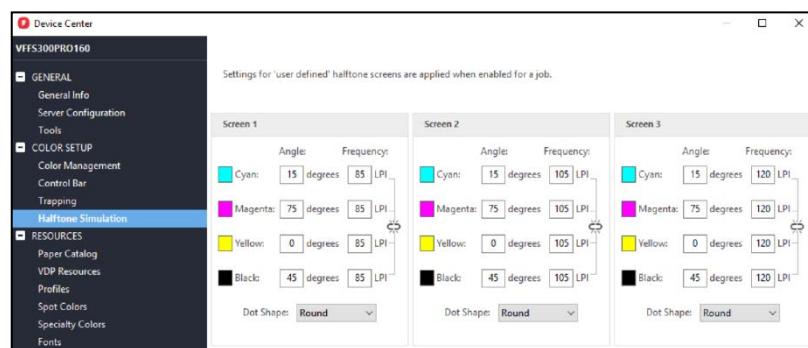

Custom or application-defined dot shape

Benefits:

Combines with the Paper Simulation feature, allowing users to simulate conventional press output for proofing

Allows users to make adjustments before plating the job

Provides accurate simulation of the screened appearance for newspapers and packaging

Configurable Auto Trapping

The feature provides users with advanced trapping settings, and offers greater flexibility and full control over trapping. Auto Trapping is optimized for Fiery Driven printers, and is fast enough that it can even be applied to variable data jobs and still run the print engine at rated speed.

The configurable parameters include:

Width

Colour reduction

Shape

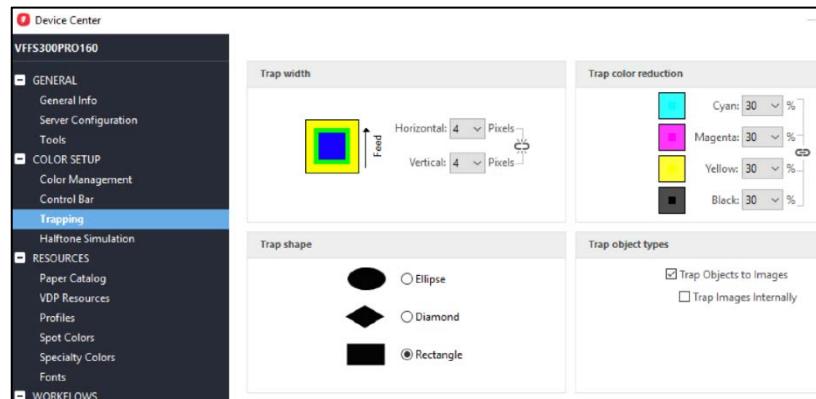

Image trapping option

Benefits:

Trap edges without performance impact, allowing users to trap complex jobs without slowing down production

Gain full control over trapping values to adapt to different printing environments and job characteristics

Hide registration imperfections that can occur when printing on stiffer media, opening up new substrate options to increase revenue

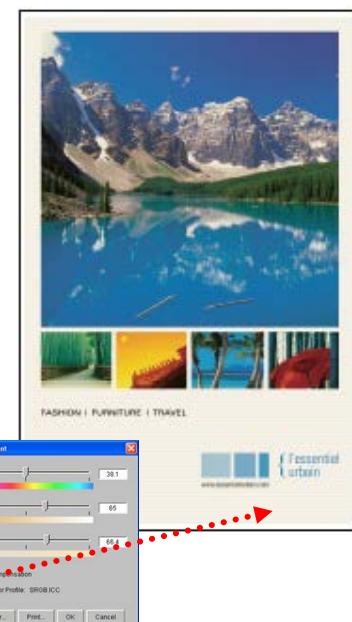

Paper simulation with White Point Editing

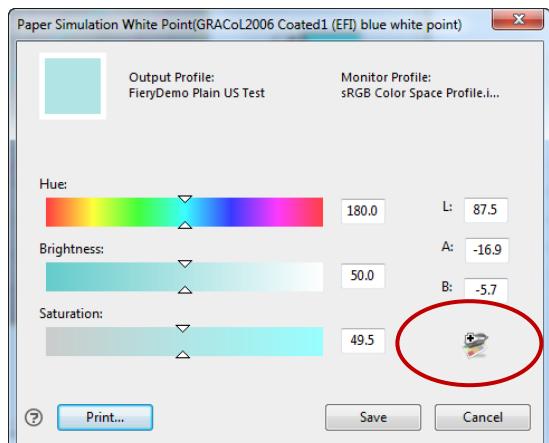

When printing proofs, it is sometimes desirable to simulate the colour of the paper that will be used on the actual press run. Users can find the White Point Editing feature in Device Center, after selecting Edit on a given profile. It provides users with intuitive tools to enter and edit the white point of a CMYK source profile so they can simulate a different paper white than that of the source profile when proofing.

Paper simulation with ES-2000/ES-3000

Paper simulation editing enables more accurate simulation of special media such as newsprint and packaging. Before, users had to manually enter the L*a*b values defining the white point of the paper. Now, operators can use an ES-2000 spectrophotometer to read the white point value of the paper and populate the L*a*b values directly into the Paper Simulation feature.

Fiery FS400 / FS400 Pro print servers – Product guide

ES-2000 is used to measure the media white point.

In addition, the feature:

Allows the user to fine-tune the hue, brightness, and saturation of the simulated paper

Downloads a custom CMYK simulation profile with the white point edit

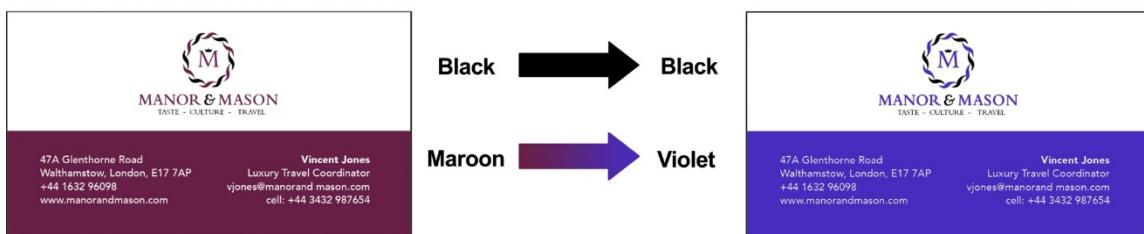

Benefit:

Let's users create custom paper simulations to match the paper white point of special media, then store and reuse those simulations for specific customers and/or print applications

2-Color Print Mapping

When artists design two-colour jobs that will run with black and one spot colour, they might not always know the spot colour at the design stage.

The 2-Color Print Mapping feature allows users to replace the black and magenta of a two-colour job with the required spot colours, without modifying the original job.

Benefits:

Ensures accurate spot colour matching from Fiery Spot-On when printing the final spot colours

Allows for last-minute decisions about spot colours

Fiery Hot Folder filters

In a high-end commercial or in-plant environment, print professionals demand compatibility and integration in their existing workflow. They also insist on proper file conversion with optimal productivity.

Fiery Hot Folders is designed to provide users with an automated method for sending print files to a Fiery server through simple drag-and-drop or print-to-file actions. Fiery FS400 Pro servers and Fiery FS400 servers with the Automation Package get a set of expert-level filters that allow Fiery Hot Folders to process jobs in native file formats. In hot folder workflows, jobs may be routed to a Fiery server with predetermined settings, including PPD overrides, imposition attributes, and file format conversions.

Benefits:

Offers seamless integration of digital production in conjunction with high-end graphic arts workflows

Fiery FS400 / FS400 Pro print servers – Product guide

Relieves users of the repetitive task of configuring multiple jobs
Reduces errors and eliminates workflow redundancies
Enhances productivity by allowing native files to be submitted without the need to launch a separate application, and by converting files in the Fiery Hot Folder application at the client, rather than on the Fiery server

Hot Folder filters include:

Filter	Description
TIFF/IT TO POSTSCRIPT	TIFF/IT is a file format used in graphic-arts environments for transfer of final print job data (often pre-screened) from one print platform to another. This filter converts TIFF/IT to pre-separated PostScript, one separation per page.
TIFF TO PDF	TIFF is a flexible, platform-independent file format used in graphic-arts environments, and for high-end graphics applications. This filter accepts all TIFF files up to TIFF 6. The filter preferences provide the user with options for scaling and positioning of the output.
1-bit TIFF (engine specific)	1-bit TIFFs are used in certain prepress environments when there is a need for fast output and predictability. They are considered the equivalent of digital film because they are locked, pre-screened files that contain all the information necessary for printing the file, including dot size and screen resolution. The ability to print 1-bit TIFFs on a Fiery Driven device allows users to simulate the conventional screening on the Fiery server.
EPS TO POSTSCRIPT	Encapsulated PostScript is a common legacy format for graphics and other page elements or pages. This format can also include text, graphics, and images. The filter preferences provide the user with options for scaling and positioning the output.
JPEG TO POSTSCRIPT	JPEG is a standardized image compression format. The filter preferences provide the user with options for scaling and positioning the output.

Fiery Workflow Suite: Makeready solutions

Producing manuals, calendars, personalized cards, business cards, newsletters, tickets and coupons, forms, and catalogs can help printers build their business and offer value-added services. These higher-profit jobs help printers differentiate services from competitors, and from what customers can do on their own.

But, in order to ensure a profitable and efficient operation, printers need a solution that's easy to use, adapts to their environment, and protects their profit margin by reducing errors and waste.

To help do that, Fiery Workflow Suite includes Fiery makeready components put robust document imposition and composition tools under one visual interface, right at prepress user's fingertips, using the Fiery Command WorkStation interface users already work with. These plug-in applications include Fiery Impose, Fiery JobMaster, and Fiery Compose.

Fiery makeready tools offer printers a flexible solution that can be available to either the local press operators, or the remote prepress specialists — without the need to invest in a dedicated desktop client. The unified workspace for all document-layout tasks simplifies labour-intensive document preparation activities and shortens job setup times for even the most complex jobs.

Fiery Impose

Imposition errors in complex jobs are costly and drain time from tight production schedules. Fiery Impose streamlines and automates the imposition process, making production more efficient. The optional Impose software launches on Command WorkStation 6, so it can run on the user's computer desktop or locally at the Fiery server.

Fiery Impose offers multiple workflows to optimize and automate the layout of multi-up jobs; considering the properties of the source file, media size, and other considerations. Fiery Impose is an intuitive and fully visual solution, designed for production environments. It provides a flexible layout imposition solution that can be available to either the local press specialists or the remote prepress operator, without the need to invest in a dedicated desktop client. The robust toolset delivers a fast, automated approach to tedious, time-consuming tasks that leave users open to errors. It extends the driver-based imposition capabilities offered by Booklet Maker, and includes content-editing capabilities without modifying native files or adding/deleting pages.

With Impose, variable data jobs with multiple records of varying length can be imposed in specific sequences to produce a variety of products such as booklets, books, coupons, and business cards.

Productivity features streamline workflow and leverage automation. Users can create unlimited user-definable imposition templates; and can apply imposition templates from Job Properties, Fiery Hot Folders, Virtual Printers, and Fiery JobFlow.

Fiery Impose has a quick and easy way to view thumbnails, or full-screen previews of actual page content in the imposition signature. It also offers page and sheet views of the imposed job. In addition, users can manage the production of imposed jobs with mixed-media requirements.

Features of Fiery Impose:

The solution works with the Fiery Command WorkStation 6 interface, and lets users perform a wide array of imposition tasks at the Fiery server or remotely on Windows or Macintosh client workstations.

Unlimited imposition templates: Creates and saves custom templates for reuse, eliminating redundant tasks and reducing errors

User Defined Finish Size: Honors the designer's intent by automatically detecting the trim and bleed boxes defined in the source document

Document assembly and edit: Displays thumbnails and full-screen previews, adds and deletes pages, offers last-minute text and image editing

VDP workflows: Includes raster preview, sample proof printing, and a control strip for quick identification of spoiled sheets

Unique cut and stack: Allows users to start cutting, sorting, and packing before jobs finish printing

PDF archive: Archives imposed jobs as PDF files for easier reprinting

Gangup styles: Has traditional unique and repeat, and other gangup styles available for VDP and non-VDP jobs

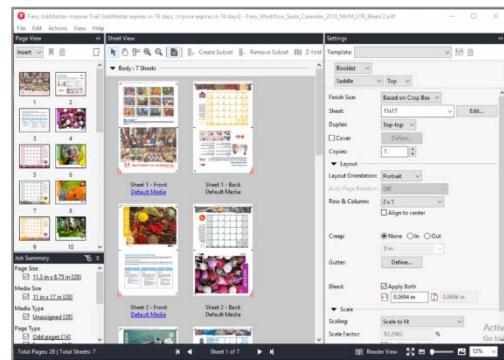

Gangup automation by media size: Calculates the best layout (n-up and orientation) on the fly using the Based on Trim Box finish size, considering a given media size.

Nonprintable area indicator: Detects overlap of image and nonprintable area to adjust layout before RIPping

Define scaling factor: Provides increased control over scaling options

Delivery options: Changes the output sequence to optimize the finishing process

Cover setup: Dynamically adjusts pagination by inserting the required blank pages for front and back cover inside pages

Fiery Impose fully visual and interactive interface

Fiery FS400 / FS400 Pro print servers – Product guide

Mixed Media: Specifies media assignment from interface with visual reference to final content, reducing errors

Mixed Media for VDP booklet covers: Allows users to set media for the covers of VDP booklets that is different than the body pages

Paper Catalog definition: Defines custom media and adds them to the Paper Catalog to make media specification faster and easier

Booklet Maker support: Supports driver-based imposition through Booklet Maker, allowing jobs to move between Impose and Booklet Maker

Measurement tool: Determines the distance between two reference points on a sheet

Creep adjustment: Adjusts for creep to deliver straight, aligned text throughout a multi-page document

Customisable trim and fold marks: Defines the colour, length, width, and type of trim and fold marks independently; and creates presets for faster setup in future jobs

Add, delete, and duplicate sheets: Inserts custom text for blank pages and adds, deletes, or duplicates imposed images without going back to the source document

Multi-up support: Offers imposition styles of up to 25 rows and 25 columns to optimize paper use for small items. Saves on click charges with page double-up feature

Auto page rotation: Automatically detects and rotates pages in a job to ensure that all pages have the same orientation

30-day free trials: Offers users a chance to experience Fiery Impose for free before purchase at efi.com/fieryimpose

Late-stage editing: Allows users to apply last-minute edits with Adobe® Acrobat® Pro

Slitter/cutter/creasers finisher integration: Reduce prepress and manual setup time by integrating Fiery Driven print engines with offline finishing equipment.

For additional information on Fiery Impose, visit efi.com/fieryimpose.

Benefits:

Provides a flexible makeready solution that can be available to either local press operators or remote prepress specialists, without the need to invest in a dedicated desktop client

Reduces print errors and saves significant time with job previews of printed output

Minimizes the complexity of imposing VDP documents

Includes booklet imposition and mixed-media settings preview for a more accurate softproof, ensuring imposed jobs are printed correctly the first time

Handles last-minute text and image editing with powerful PDF editing capabilities

Simplifies page merging with drag-and-drop ease, and improves accuracy with specified placement in long documents

User Defined Finish Size

Designers typically design documents to be printed based on their final finished, or trimmed, size. This finish size is often smaller than the sheet size on which they are printed. The PDF definition of the final finish size is the “trim box.” In addition, designers may define content to bleed beyond the final finished size. This bleed-box value gives the user and finishing equipment some latitude in finishing the document to prevent unexpected white space between the specified finish size and actual trimmed size. The imposition of the job, including placement of trim marks, is based on the finish size of the job.

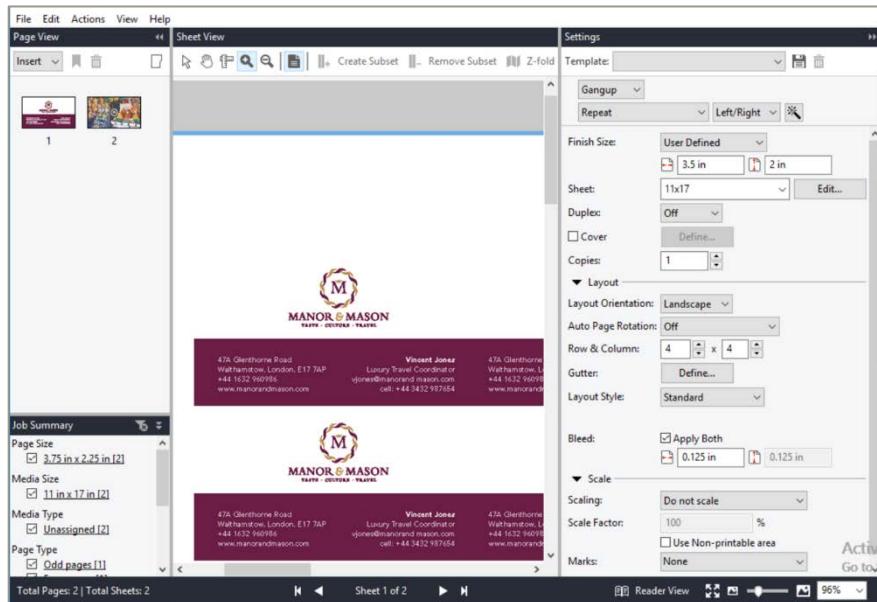

Previously, users had to set up files for imposition by using Fiery Impose bleed values to set the finish size. Additionally, users or designers sometimes needed to modify original files and define a custom page size to define a bleed, which affected the positioning of content on the page.

With Command WorkStation, Fiery Impose takes advantage of the designer-defined trim box and bleed-box information incorporated in the file. The user can select User Defined as the Finish Size setting. This maps the trim-box value in the file to the Impose Finish Size setting. The system also reads and applies the bleed value defined in the document.

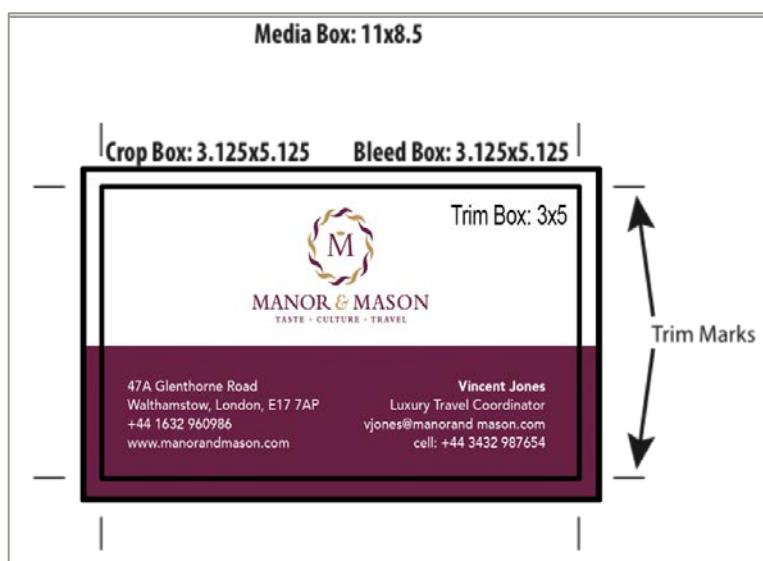

Fiery FS400 / FS400 Pro print servers – Product guide

Support for designer-defined trim and bleed definitions means the print operator does not have to spend time determining the finish size and bleed size in Impose, or make modifications to the original file to impose and print the file. With the User Defined Finish Size feature, Impose automatically imposes the job based on the designers' finish size definition.

In addition, Impose can accurately impose and print jobs composed of several PDF files with unique trim and bleed sizes, and page (media box) sizes.

User Defined Finish Size controls

PDF definitions for bleed and trim marks

Benefits:

Improves usability, as the designer defines the desired trim and bleed sizes in the document, and allows imposition to be done with files containing different trim and bleed sizes

Eliminates the need to modify original documents for faster imposition job setup and a tighter focus on production

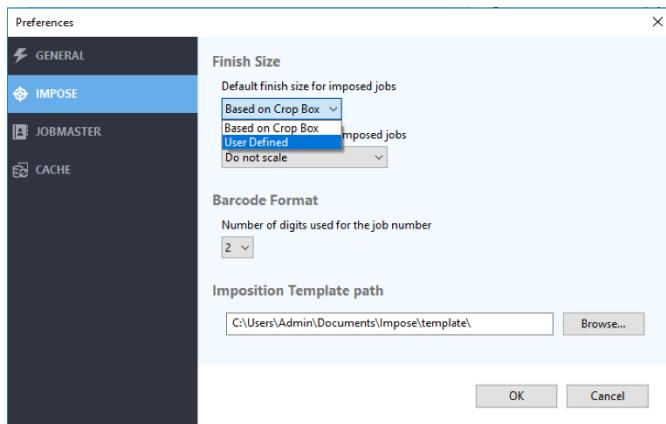

Saves time and money by reducing miscommunication and print errors

User Defined Finish Size preference

With the User Defined Finish Size preference in Fiery Impose, operators who always want to impose jobs based on the user-defined finish size (trim box), rather than on the default crop box, have a way to specify

Fiery FS400 / FS400 Pro print servers – Product guide

either crop box or user-defined finish size for all jobs opened in Impose. This gives users two options for imposing jobs: the crop box and the trim box. The new preference allows operators to choose a default imposition method.

Choose the defaults for Fiery Impose.

Benefits:

Provides additional flexibility

Allows the user to select a setting in Preferences and maintain that setting, never having to change it in Impose again

Layout Offset

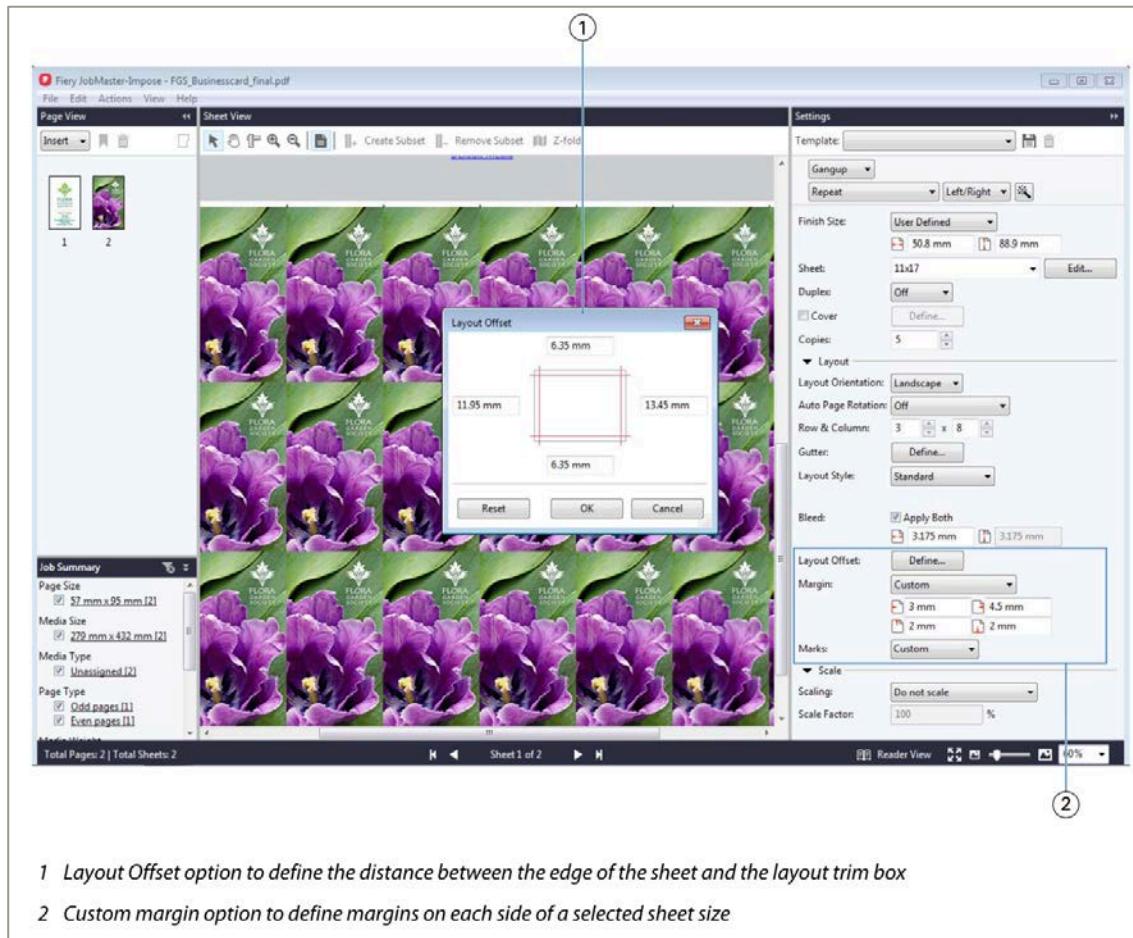

Layout Offset moves the entire layout on the sheet surface to accommodate additional space required by finishers for gripping or trimming a sheet. Using the Layout Offset option, users can define the distance between the edge of the sheet and the layout trim box, in all four sides, so that the layout is off-centered. Save the Layout Offset settings in Fiery Impose templates, so that you can use these settings for future jobs with workflow automation.

Custom Sheet Margins

This feature allows users to define margins on each side of a selected sheet size. Layout margin is the distance between the sheet edge and the layout edge. By default, the sheet margin is the non-printable area.

Users can adjust these margins to maximize the layout area and meet the margin requirements of an offline finisher.

Fiery FS400 / FS400 Pro print servers – Product guide

Automation workflow support

This section clarifies licensing requirements by Fiery system software and automation workflow type.

A Fiery Impose license is always required wherever users create an imposition template. Licensing requirements differ when using imposition templates, depending on the type of finish size chosen for the template.

Requirements for User Defined and Based on Trim Box finish size

Fiery Hot Folders and Fiery JobFlow require a Fiery Impose license on the client workstation

Virtual Printers, Server Presets, and Job Properties require a Fiery Impose license on the Fiery server (FS200 Pro and above only)

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery system version	To use Impose templates for User Defined and Based on Trim Box finish sizes				
	Requires Impose license installed on the <u>client computer</u>	Requires Impose license installed on the Fiery <u>server</u>			
	Hot Folders	JobFlow	Job Properties	Server Presets	Virtual Printers
FS400 Pro, FS350 Pro, FS300 Pro, FS200 Pro,	✓	✓	✓	✓	✓
FS400, FS350, FS300, FS200, FS150 Pro / FS150, FS100 Pro /FS100 System 10 / 10e	✓	✓	Not supported	Not supported	Not supported

Starting with Fiery FS200 Pro system software, users no longer need to upgrade their Fiery server to benefit from new imposition capabilities; especially imposition automation with User Defined and Based on Trim Box finish size templates through Job Properties, Server Preset, and Virtual Printers. Fiery users can get new capabilities built for these finish sizes, simply by:

Installing the latest Fiery Command WorkStation version on the Fiery server

Activating a Fiery Impose license on the Fiery server for server-based workflows

Integration with slitter/cutter/creaser offline finishing equipment

Fiery Impose now integrates with all major offline slitter/cutter/creaser devices to help eliminate time-consuming and duplicated manual setups. Users can automate the job preparation process all the way from prepress to post press, to guarantee the final products are produced efficiently and with minimal waste. With Fiery Driven™ workflows, jobs can be prepped in just one click to save up to 70% in setup time, with fewer errors and less waste. Find the supported finisher model and a how-to guide which includes premade Fiery Impose templates for each partner brand:

Duplo imposition layout options

The new Duplo imposition layouts are intended for post-processing with a Duplo offline finisher. The new layouts handle the PDF formats most commonly finished with these Duplo offline finishers.

Fiery FS400 / FS400 Pro print servers – Product guide

The new selections are Duplo long-edge and Duplo short-edge impositions for non-VDP PDF and PostScript files.

Benefit:

Extends Duplo offline finisher support to streamline print production from job prep to finishing

Duplo finisher layout import

Fiery Impose has been introducing significant improvements to the integration between Fiery Impose and Duplo finishers since Fiery System 10 software. The improvements first introduced in Fiery Command WorkStation 6.2 bring increased automation of offline finishing for custom layouts. With this feature, users can import the layout file for the Duplo finisher into Fiery Impose to set up imposition in seconds and automate future jobs to eliminate manual setup on the Duplo finisher.

When users create the layout file on the Duplo finisher, they can import this file into Fiery Impose. This will automatically set up the imposition layout as defined by the Duplo layout file, which ensures a perfect match with the finisher's settings and minimizes user errors and rework.

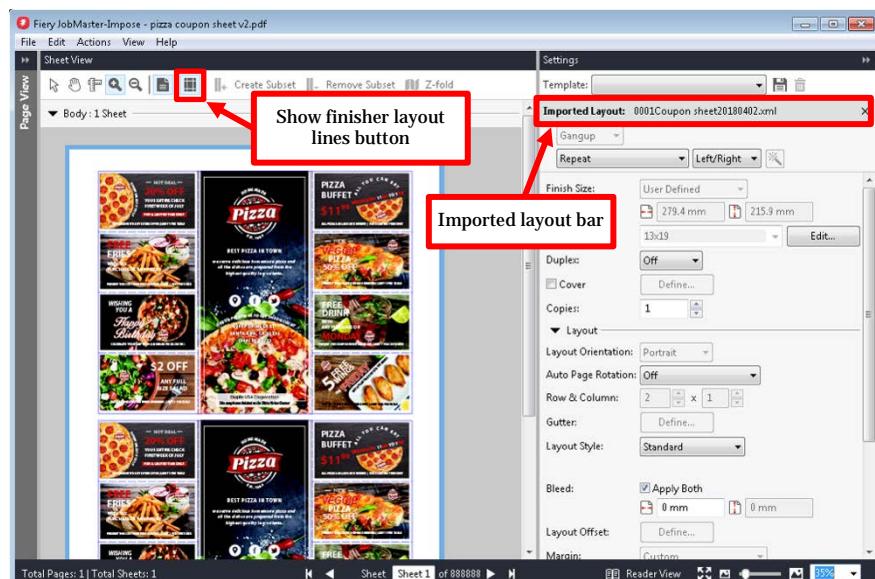

While working on the layout in Impose, users have the option to apply additional Impose settings, such as duplex, that will affect only the settings that aren't grayed out. Settings that are grayed out, or not enabled, are ones controlled by the layout file and necessary to guarantee precise finishing by the Duplo finisher. For additional flexibility, Fiery Impose offers users the option to unlock those disabled features by closing the Imported Layout bar in the Settings panel.

When applying the Duplo layout file to a job with Fiery Impose, users can preview the alignment of the page content with finishing lines set up on the Duplo finisher, such as fold and perforation lines. Just click on the new "Show finisher layout lines" button on the toolbar.

Users can create a template to automate future jobs. These templates save all the layout settings and let users preview the finishing lines. Templates can then be used in all automation workflows including Fiery Hot Folders, Virtual Printers, server presets, and Fiery JobFlow™.

Before the first use, turn on the import feature for the Duplo finisher layout in the Fiery Impose Preferences section.

Supported Duplo finishers include the Duplo DC-646 / DC-746 Slitter/Cutter/Creaser.

Duplo finisher layout import

Fiery FS400 / FS400 Pro print servers – Product guide

Learn more about this feature by watching [this Express Video](#), following the easy set up procedures in [this how-to guide](#), or visiting www.efi.com/impose.

Print marks on front surface only

The checkbox Print marks on front surface only at the bottom of the Marks window of Fiery Impose, prevents the printing of trim and fold marks, job labels, and blank page text on the back of a page when shops are using duplex printing. Because trim marks are only necessary on one side of a page, this prevents unwanted marks on the second side of a duplex page.

Benefit:

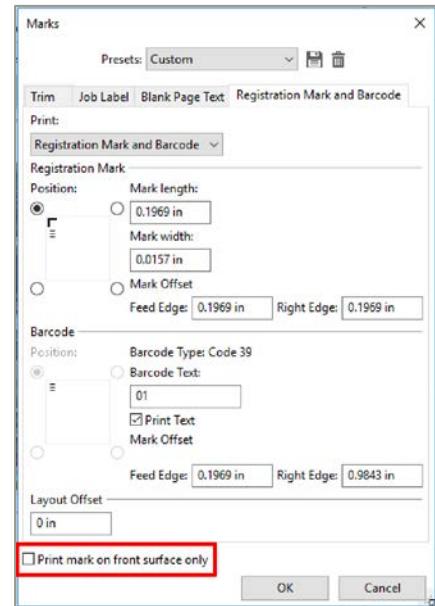

Prevents unwanted marks that might not be trimmed off if the marks don't line up exactly on both sides of a duplex page

25x25 gangup

The Fiery Impose gangup row and column repeat limit has been extended to 25x25. An added wireframe preview provides fast previews for gangups over 10x10. Printers often request this feature – especially for printing stamps, tickets, and thumbnails on one page.

Benefit:

Saves paper and click count with higher gangup repeats on one larger sheet of paper

Print mark on front surface only check box

Gangup finish-edge selection

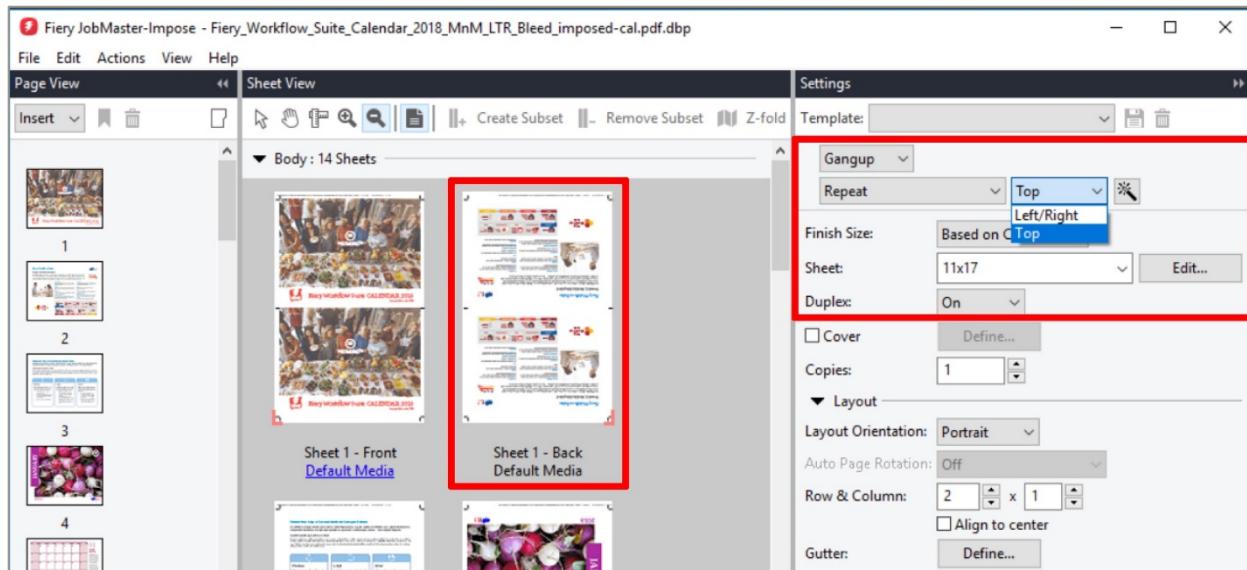

Print applications such as wall calendars and some financial statements, that are imposed for top-bound finishing, require all back pages to rotate 180 degrees in order to show the correct page orientation for the finished spread.

Before, designers could manually rotate the back page for individual sheets when producing the file to print. This new feature makes the rotation automatic for all back pages in a gangup imposition. Just choose the new Top binding edge selection when imposing a job with duplex gangup-repeat, unique-collate cut, or Duplo styles.

Calendars using gangup-repeat imposition style and top binding edge

Fiery FS400 / FS400 Pro print servers – Product guide

Gangup finish-edge selection is enabled when choosing Gangup, Repeat, and Duplex: On settings. See how the pages on the back of sheet 1 were rotated 180 degrees.

Benefits:

Improves user productivity and throughput when using preset-based workflows such as Fiery Hot Folders, Virtual Printers, and JobFlow

The settings can be saved as a Fiery Impose template so that users can automate page rotations for upcoming regular or VDP jobs that require duplex with top-finished edge

Gangup automation by media size

Gangup imposition templates can use the new Based on Trim Box finish size that uses the trim box defined in the document. Fiery Impose calculates the best layout (n-up and orientation) on the fly, considering the desired media size.

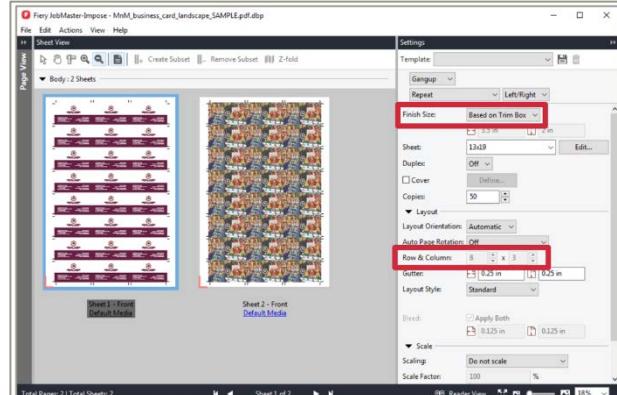

Based on Trim Box finish size reads the trim box of the first page of the document, and disables the row and column fields. When the user selects the sheet size, Impose automatically calculates the row and column values to maximize the sheet surface.

The best-fit for gangup feature can be saved as a template to automate layout. However, gangup unique and repeat is a different layout type. Each type requires a separate template per media size.

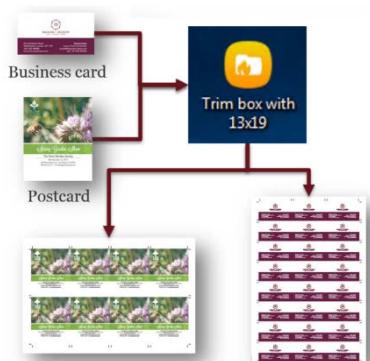

Even with that, users will have fewer gangup templates to manage, with only one imposition template per gangup type and sheet size.

Imposition templates created with the Based on Trim Box finish size setting can be used in Fiery Hot Folders and Fiery JobFlow* workflows.

For example, users can set up a single hot folder for 13x19-inch media to process business cards and post cards. Fiery Impose will produce the best-fit layout for each product size, while maximizing the paper usage. This type of workflow will greatly reduce the time and effort required to set up gangup automation

Based on Trim Box finished size

Fiery FS400 / FS400 Pro print servers – Product guide

PDF Print Engine acceleration for long gangup jobs

This feature enables faster processing for gangup jobs when using the APPE processing path.

The performance improvement applies to jobs with more than 1,000 pages.

Processing speed is about 10% faster for 1,000-page jobs, and it gets faster as jobs get longer. A 10,000-page job can process 2.5 times faster on average (for example, going from 12 to 3.5 minutes to process a job).

This feature is available for external Fiery servers only.

Auto page rotation

When jobs come in, they sometimes contain pages created with a different page orientation than the rest of the document. This requires users to pick out those pages, and rotate them to print with the right orientation and paper size.

With Auto Page Rotation, Fiery Impose can automatically detect and rotate pages in a job to ensure that all pages have the same orientation. Users can also include the rotation requirements in a Fiery Impose template, and apply it to automation workflows using User Defined or Based on Trim Box finish sizes.

This capability is especially important for transactional printing, where a job contains hundreds or thousands of pages, and some pages need to be rotated before the job can be imposed.

Auto Page Rotation can be automated with Imposition templates using Fiery Hot Folders and Fiery JobFlow workflows.

The screenshot shows the Fiery JobMaster-Impose software interface. On the left, there's a preview of the document structure with numbered pages. In the center, there's a preview of the imposition layout. On the right, the 'Settings' panel is open, showing various options for the imposition. Two specific sections are highlighted with red boxes: 'Finish Size' set to 'User Defined' and 'Auto Page Rotation' set to 'Clockwise 90°'. Other visible settings include 'Booklet' and 'Saddle' binding types, and a layout orientation of 'Landscape'.

Auto page rotation

Presets for marks

Users tend to use the same printer marks repeatedly. Now they can save their preferred mark settings as presets on a client computer and reuse them for future jobs. The ability to reuse mark settings with one click will help users speed up their imposition setup.

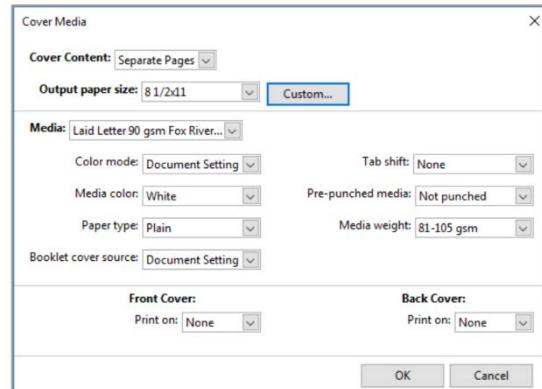

The screenshot shows the 'Marks' dialog box. The 'Presets' dropdown menu is open, showing options like 'None', 'Blue marks', 'Booklets', 'Business cards', and 'Postcards'. Below the dropdown, there are fields for 'Horizontal length', 'Vertical length', 'Stroke type', 'Stroke width', 'Stroke color', and 'Offset'. At the bottom, there are 'OK' and 'Cancel' buttons.

Presets for marks

Fiery FS400 / FS400 Pro print servers – Product guide

Mixed Media for VDP booklet covers

With variable data printing becoming more popular, users like the capability to define a booklet layout for VDP jobs with Fiery Impose. This new feature will allow users to set media for the covers of VDP booklets that is different than the body pages. It's supported in external Fiery servers running Fiery FS150 Pro software and above.

Cover Media definition for VDP jobs

Modify PS to PDF conversion option

The PS to PDF conversion occurs every time a PostScript (PS) file requires the use of imposition functions in the print driver, Job Properties, or a server preset.

These imposition functions are found at the Layout tab in Job Properties and include booklet, gangup, and Impose settings.

The conversion of PS to PDF is defined by a jobOptions file created with Acrobat Distiller. A variety of settings control how the conversion occurs. The factory jobOptions file is "Fieryoptimized2" and users can see all settings using Acrobat Distiller.

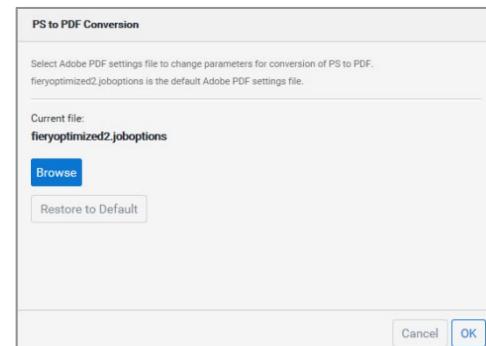

In some specific scenarios, users may need to change some of the settings in Fieryoptimized2 to adapt the PDF conversion to their workflow needs. For example, a user could use a jobOptions file that ensures all pages print with black toner only, preventing a colour click charges, or use a jobOptions file that reduces the file size, therefore speeding up the RIP time. Any setting that Distiller offers could potentially be set in a jobOptions file to help solve a specific workflow problem.

This new feature provides users with the flexibility to customize the Adobe Distiller jobOptions file by uploading the new file to the Job Management section in Fiery Configure.

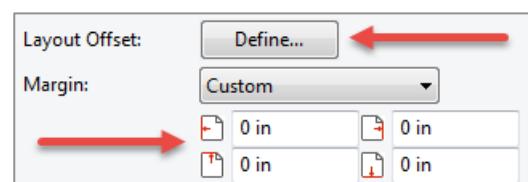

Automation for layout offset and margin settings

This feature enables users to save the layout offset and sheet margin settings in Fiery Impose to a template. With this template, they can then automate the offset using Fiery workflows through Fiery Hot Folders, virtual printers, server presets, and Fiery JobFlow.

For more information on the layout offset and margin settings features visit the Fiery Command WorkStation 6.1 [what's new document](#).

Select a different jobOptions file in Fiery Configure

Layout offset and margin settings in Fiery Impose

Fiery FS400 / FS400 Pro print servers – Product guide

Free 30-day trials

Similar to Fiery JobMaster; Fiery JobFlow; and Fiery Graphic Arts Pro Package, users have a chance to experience the benefits of Fiery Impose for free for 30 days. Users can request a 30-day trial license at efi.com/impose.

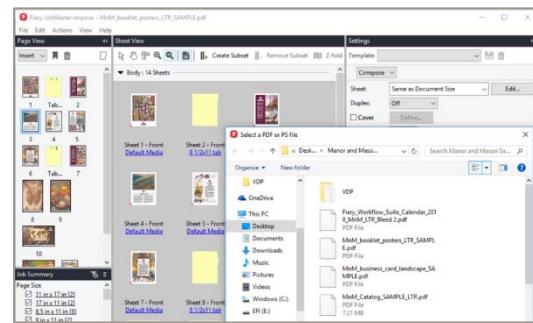

A Fiery Impose, Compose and JobMaster trial licenses will not give users access to Acrobat Pro. This additional tool is available as a separate option.

Fiery Compose

Fiery Compose provides centralized document assembly, page-level ticketing, content preview, and powerful editing features including a tab creation interface. Compose is designed to be the core toolset that operators use to prepare documents for printing. Because Compose launches from Command WorkStation 6, it can run on the user's desktop computer in prepress or locally at the Fiery server.

Compose provides Fiery servers with an advanced preview and editing environment. Its wide range of sophisticated document composition tools and advanced visual user interface improve document verification, speed up composition, and enable less experienced users to perform complex document functions. In addition, sophisticated tools with familiar Fiery user interfaces reduce training requirements and increase the user's resource base.

From a single integrated window, users manage tabs and specify mixed media, taking advantage of the fully automated digital printing process to produce finished documents with minimal user intervention.

Integration with the Paper Catalog's centralized paper warehouse database also makes it intuitive for users to apply media specifications on a per-page or per-chapter basis, and improves paper management across the entire production environment.

For flexible document assembly, users can drag and drop files from the desktop and select pages from jobs anywhere on the network, or from the Fiery job list. Operators can use a unique workspace for all document layout tasks by adding Fiery Impose software. With it, users can incorporate visual and intuitive document imposition. Impose and Compose work together to simplify labour-intensive document preparation activities and shorten job setup times of even the most complex jobs.

Compose provides centralized document assembly, page content preview, and editing. Functions include:

Page view: Simplifies document setup and navigation in large jobs. Enables users to view the entire document — including inserts, tabs, and chapter starts — and visually confirm media colour information.

Page-level ticketing: Processes complex documents with a visual content display, decreasing potential for error.

Chapter definition: Offers quick and easy setup of page ranges within documents, and application of media attributes for page ranges.

Tab printing: Provides intuitive tab printing functions; allowing users to insert, add, or remove tabs. Offers visual tab text editing. Manages up to 100 tabs, and tab banks of up to 15 cuts.

Direct PDF insertion: Provides simple merging of PDF pages within documents or between documents.

Late-stage PDF editing: Integrates Adobe Acrobat for quick and easy last-minute PDF changes.

Convert to Grayscale: Easily specify any page or sheet surface to print in black and white during the makeready stage to save on click charges.

Mixed finishing sets: Streamlines the assembly process to produce a fully finished job. With inline finishers attached to the print engine such as stapler, hole punch, or z-fold; users can select multiple options and apply them to subsets in a job.

Fiery Compose supports the following job formats:

- PDF
- PostScript
- VDP

Fiery FS400 / FS400 Pro print servers – Product guide

For additional information on Fiery Compose, visit efi.com/fierycompose.

Benefits:

- Provides a flexible makeready solution that can be available to either local press operators or remote prepress specialists, without the need to invest in a dedicated desktop client
- Processes complex documents with a visual job display, decreasing the potential for error
- Reduces training requirements with sophisticated tools using a familiar Fiery user interface
- Enables quick and easy setup of page ranges and chapter definitions
- Simplifies page merging with drag-and-drop ease
- Allows users to create tabs and specify mixed media from a single integrated window, and also produces finished documents with minimal operator intervention

Fiery JobMaster

Fiery JobMaster provides advanced PDF-based makeready functions. In addition to all features included in Fiery Compose, Fiery JobMaster offers fully visual tab insertion and design, advanced page numbering, scanning, stamping, and powerful late-stage editing features. Users launch Fiery JobMaster by selecting a job from the Fiery Command WorkStation user interface. It can run on a PC or Mac client workstation in a prepress department, or locally at the Fiery server. Users can add Fiery Impose to integrate all makeready tasks in a single application. Built with the familiar Fiery user interface, users can be up and running quickly, producing high-value jobs. Fiery JobMaster allows users to easily prepare complex jobs inside a single application and integrates with Adobe Acrobat Pro (available as a separate purchase).

Fiery JobMaster includes the features found in Fiery Compose in addition to the following features:

- Quick page selection:** Allows users to accelerate job preparation by navigating long documents and locating pages quickly by filtering page properties
- Advanced tab creation with visual content preview:** The preview changes dynamically as users specify tab ear settings and content that can include images, colour background, logos, and formatted text.
- Import scanned images:** In addition to scanning documents directly into JobMaster using Fiery Remote Scan or supported 3rd party scanners, users can insert previously scanned documents into the job assembly process with advanced cleanup tools.
- Cleanup tools for scanned documents:** Users can de-skew and de-speckle scanned documents; edit images for brightness, contrast, and sharpness; make pages fit to the desired media size for a uniform appearance on every page; mask out staples, hole-punch marks, or page content.
- Page editing:** Users can redefine crop and trim box sizes and mask unwanted content such as preexisting page numbers. Edits are non-destructive and can be removed or modified at any time before production.
- Image editing:** Users can touch up scanned pages without leaving Fiery JobMaster. With it, users can open any third-party image editor installed on a client computer. This might include Microsoft Paint, GIMP, Adobe® Photoshop®, and Preview for macOS.
- Page numbering and stamping:** JobMaster adds page numbers anywhere on the page, can skip page numbers for inserts and tabs, and includes page-number templates for predefined numbering styles.
- Image stamping:** Easily adds company logos, watermarks, and graphic illustrations to documents in the makeready process. This allows users to customize a job quickly, without requiring a designer to go back to the native application.
- Job duplication:** Replicates a page or a set of pages to produce forms, coupons, and ticketing jobs with ease
- NCR form creation:** Allows users to quickly create multi-part forms and fulfill complex numbering and stamping requirements

Benefits:

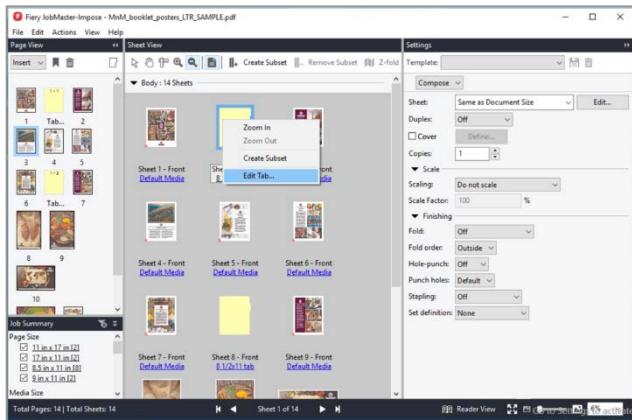

- Provides a makeready solution that is fully integrated with Fiery Impose
- Provides a flexible makeready solution that can be available to either local press operators or remote prepress operators, without the need to invest in a dedicated desktop client
- Offers the ability to edit a job by adding scanned pages and visual tabs, and by removing and adding page numbers

Fiery FS400 / FS400 Pro print servers – Product guide

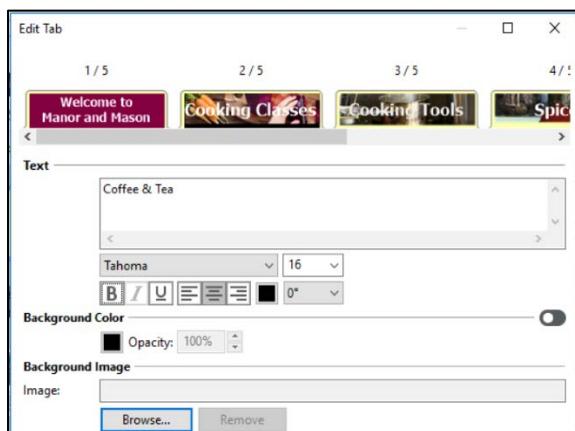

Allows users to cost-effectively produce complex jobs efficiently and inline

Supports both black-and-white and colour workflows

For more information on Fiery JobMaster, please visit efi.com/FieryJobMaster.

Fiery JobMaster visual interface

Fiery JobMaster tab editor interface

Bleed Edge Tabs

The Bleed Edge Tabs feature in Fiery JobMaster allows users to produce fully finished long documents with well-defined sections, without the need to use special tab media.

This feature automatically applies bleed-edge tab settings to all pages in the chapter, incrementing the tab position for each successive chapter. In order for the tab ears to show the colour at the edge of the page, the finished job needs to be trimmed at the edge of the book.

Benefits:

Helps produce fully finished jobs with well-defined sections, without the use of special tab media

Offers printers a new and different type of value-added application to provide their customers

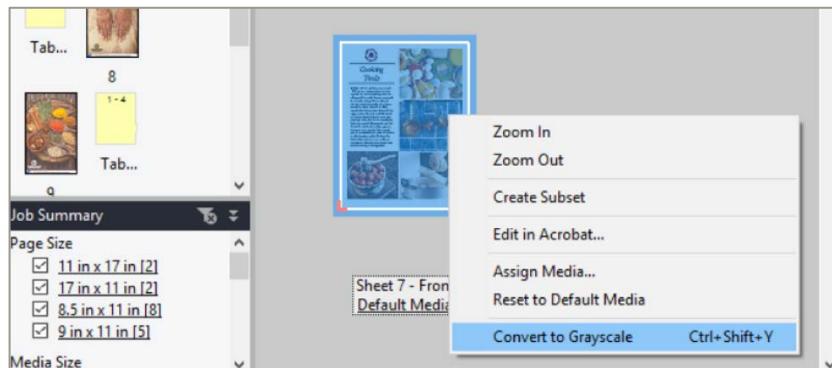

Convert to Grayscale

This feature is available on both Fiery Compose and Fiery JobMaster.

Users can easily specify for any page or sheet surface to print in black and white during the makeready stage.

Fiery FS400 / FS400 Pro print servers – Product guide

The Convert to Grayscale feature saves on click charges and easily fulfills the designer's intent for a printed piece. Applying grayscale conversion at the sheet level ensures click savings for imposed documents such as booklets or gangups.

Convert to Grayscale takes place either in the Page View or Sheet View panels. Once the selected pages or sheet surfaces are converted, changes are reflected in the Sheet View panel.

The conversion is non-destructive. This means that once the job has been saved back to the Held queue, operators can apply further edits to reverse the conversion if necessary.

This feature is useful in scenarios such as these:

A long manual that is heavy on text has blue hyperlinks throughout the document. If the customer doesn't care if hyperlinks print in blue, the user can turn all body sheets into grayscale in Sheet View to save on click charges, after laying out the booklet.

A customer wants the back of her business card printed in black and white. The user selects the back page in the Page View panel and converts it to grayscale.

Auto Tabs

The Auto Tabs feature creates tab sheets, places them in the right location, and populates the tab ear content automatically by using text from the bookmark links of PDF documents.

This streamlines makeready and reduces errors that can happen during manual assembly of tab jobs.

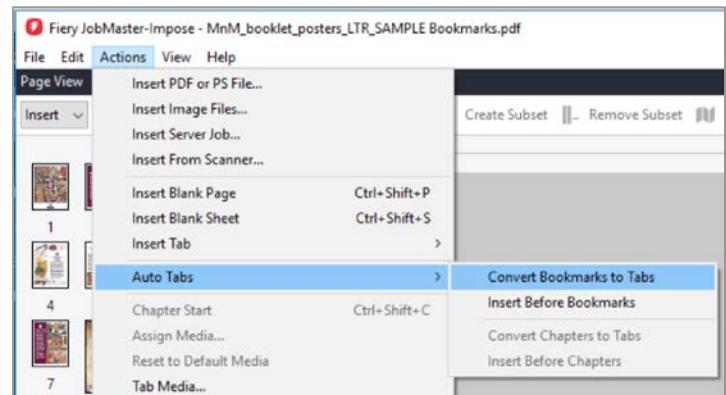

With Auto Tabs, users can also reduce the time to prepare a tab job from 20 to 50 minutes, to less than 5 minutes.

Auto Tabs is especially valuable for long documents that require well-defined chapters or sections; such as training manuals, reports, or course packs.

This feature is useful in these scenarios and more:

The print buyer provides a PDF file for each section of a training manual. The user combines those files into one document using Adobe Acrobat, which merges each section into a single PDF file and automatically creates bookmarks at the beginning of each section. Bookmarks retain the names of their PDF files.

The print buyer includes all tab information in the PDF print file, rather than creating tab instructions and tab ear content in a separate document.

Fiery FS400 / FS400 Pro print servers – Product guide

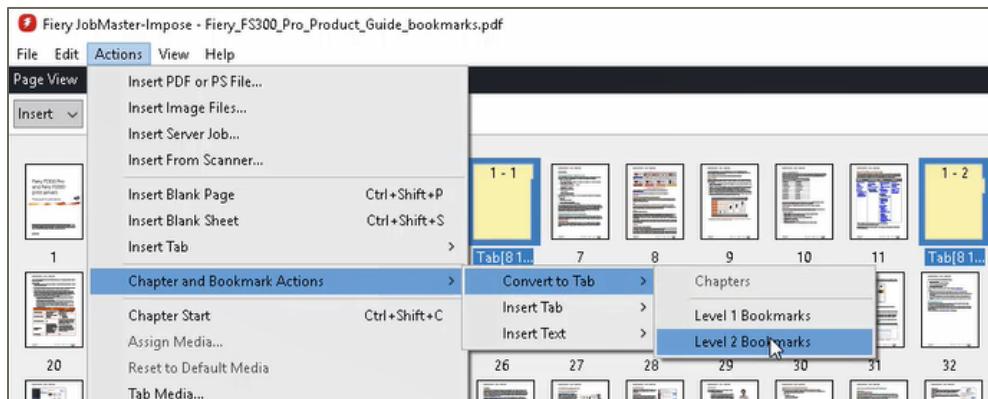

Auto tabs and text stamping by PDF bookmark level

Fiery JobMaster takes advantage of PDF bookmarks of up to 6 levels to automatically create tab pages in the job.

With PDF bookmarks, users can:

- Insert a tab page before the bookmarked page
- Convert the bookmarked page into a tab
- Populate the tab ear text
- Insert the bookmark text into the page (for example, add chapter name in headers)

This feature dramatically reduces job setup time: a long job can take 5 minutes to prepare, while it usually takes 20 minutes or more without this feature.

Bookmark actions available in Fiery JobMaster

Advanced Page Numbering

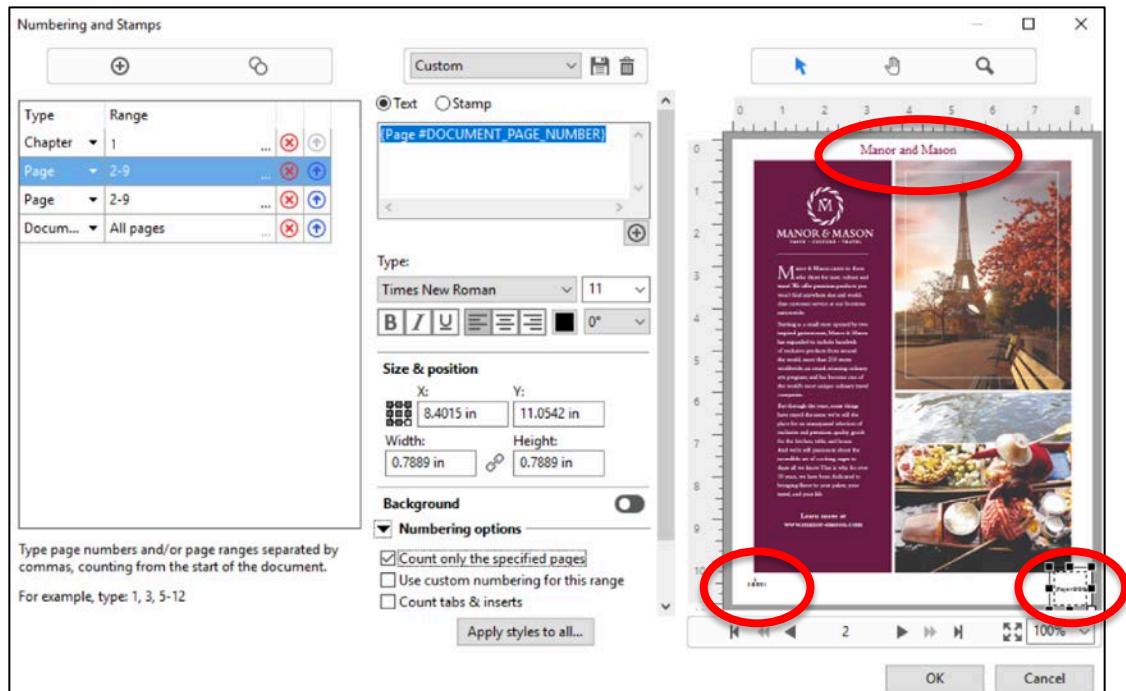

Makeready of long, complex jobs requires the ability to apply different page number sequences or formats to the multiple sections within a document. The expanded page-numbering tool in JobMaster includes advanced capabilities to cater to these demands.

Advanced Page Numbering offers ease of use and flexibility to meet various document numbering requirements in long documents. It allows users to create unique numbering sequences for one or multiple sections, using a combination of custom text, formats, and macros.

Useful scenarios for this feature include:

- A technical manual contains an appendix and a main section, each requiring a different format. An appendix might call for Roman numerals (i, ii, iii), while the main section uses Arabic numerals (1, 2, 3). With Advanced Page Numbering users can define all page numbering formats at once.
- A job requires restarting page numbers because of inserts and dividers that should not be numbered. Advanced Page Numbering can automatically detect chapter starts to skip and restart numbering.
- Another job needs all pages to display the chapter name on top as a header, and the page number on the bottom of the page. Advanced Page Numbering can add both macros to the same page without returning to the native files to add chapter names.

Fiery FS400 / FS400 Pro print servers – Product guide

More than one page-numbering sequence can be applied to a single page.

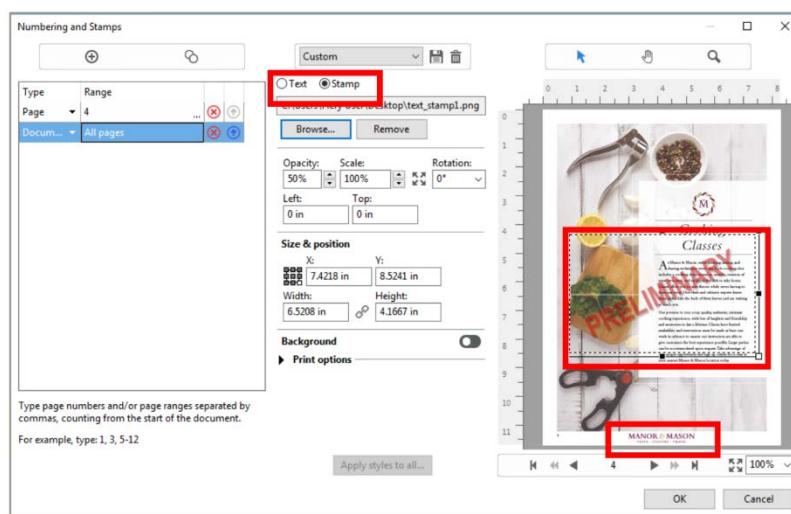

Image stamping

Users now have an easy way to add company logos, watermarks, and graphic illustrations to documents in the makeready process. This allows users to customize a job quickly without requiring a designer to go back to the native application.

They can add images to a page or a range of pages with just a couple of clicks. There is no limit to the quantity of images users can add, and pages can have more than one image on them.

The Image Stamping feature offers a wide variety of adjustments that provide finer control of stamp placement, and give users more confidence that they can comply with a customer's job requirements and deliver a more polished job.

Users can preview all image adjustments with instant visual feedback. Some of the adjustments include image location, opacity, size, rotation, offset, and background colour.

Stamp options

Fiery FS400 / FS400 Pro print servers – Product guide

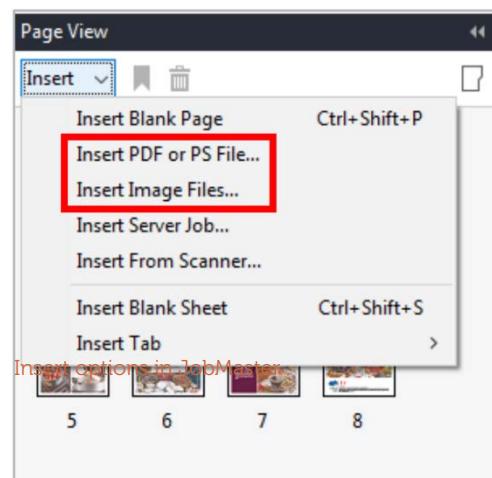

Import scanned images

In addition to scanning documents directly into JobMaster using Fiery Remote Scan or other supported 3rd party scanners, users can insert previously scanned documents into the job assembly process with enhanced cleanup tools.

Users can insert scanned documents in PDF or in all commonly used image file formats (bmp, gif, jpg, jpeg, pdf, tif, png, and tiff).

When users insert files, JobMaster automatically detects scanned pages in the document and will display only the scanned pages in the Preview & Edit window for cleanup.

Poorly scanned documents may need additional manual de-skewing. New fine rotation controls in the Preview & Edit interface let users apply up to 15 degrees of rotation to the selected pages.

With this feature, there are now three ways users can insert scanned documents:

Inserting PDF files — JobMaster can automatically detect if there are scanned pages in the document, and will display only the scanned pages in the Preview & Edit window for cleanup before inserting the file.

Inserting an image file — Users select one or multiple image files, and JobMaster will display the scanned pages in the Preview & Edit window for cleanup before inserting the files.

Inserting from scanner — JobMaster performs the scanning process and presents the Preview & Edit window before importing the file.

Image editing

The image editing feature enables users to touch up scanned pages without leaving Fiery JobMaster. With it, users can open any third-party image editor installed on a client computer. This might include Microsoft Paint, GIMP, Adobe® Photoshop®, and Preview for macOS.

Then users can apply image-editing functions offered by user-preferred third party image editor. Commonly used image editing functions include adding content, deleting content, pasting or moving content on the page or between pages, and more.

Once the user saves the edits and closes the image-editing application, the edits are instantly available to preview in Fiery JobMaster to make editing a seamless and error-free task.

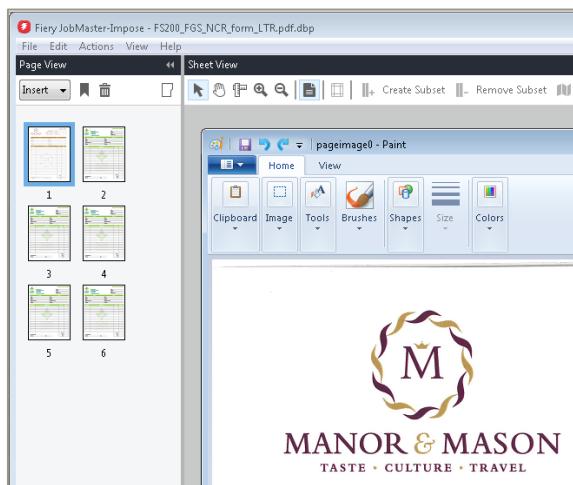

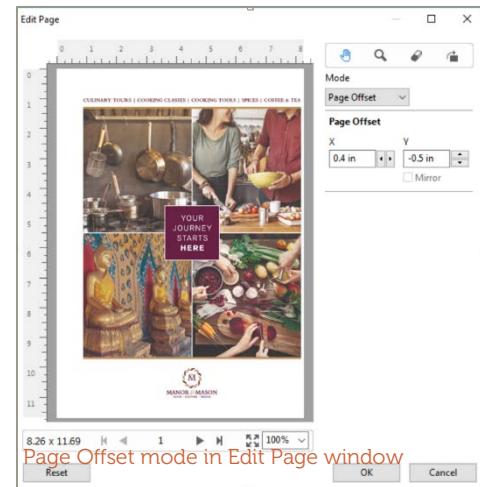

Image editing in Fiery JobMaster

Fiery FS400 / FS400 Pro print servers – Product guide

Page offset

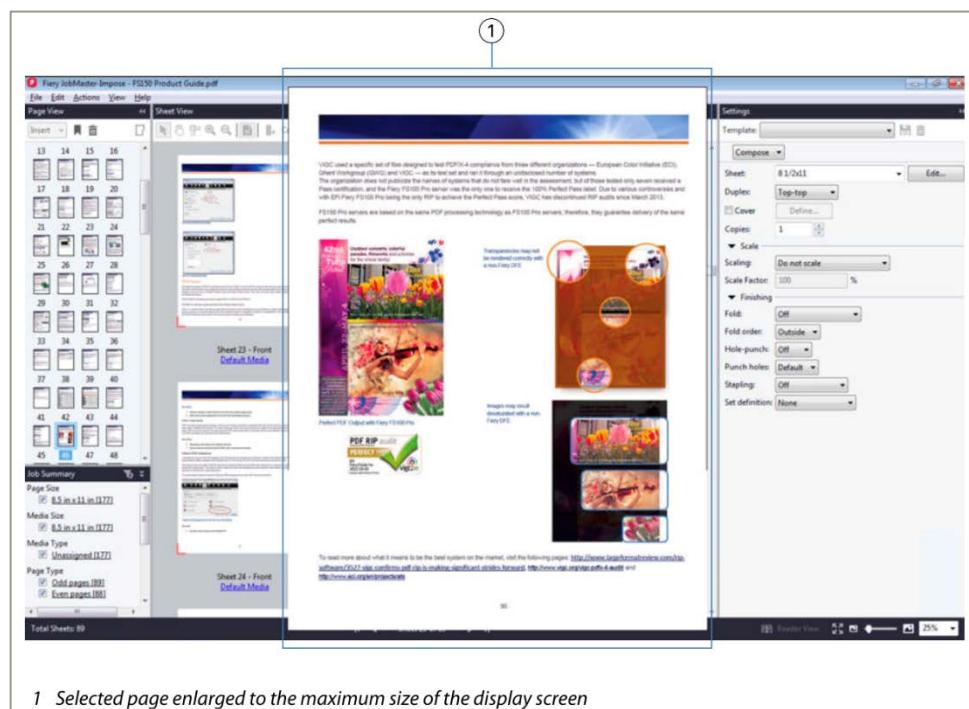

Now users can easily move page content to accommodate various finishing requirements in the Page Edit interface. They can move the page placement up and down vertically, and left and right horizontally to make room for finishing such as hole punch, bleed-edge tabs, staples, or coil binding. They can also mirror the new page placement in duplex jobs.

This type of fast page-content adjustment helps users deliver professional-looking print products quickly.

Quick zoom

The Quick zoom feature helps users quickly and efficiently identify pages that need to be edited. Press the Alt key and right-click a page in the Page View of Fiery Impose, Fiery Compose, or Fiery JobMaster to show the selected page enlarged to the maximum size of the display screen. Release the right-click to close the enlarged page image.

Enlarged view after pressing the Alt key and right-click on a page

Job submission and settings

Fiery driver

The ability to easily and accurately submit jobs to the Fiery server is one of the most important features for users. The Fiery driver provides a printing interface that offers a simplified user experience, highlighting the basic printing options most commonly required in an office environment. With the Fiery driver, features and functions are consistent across different Windows and Apple operating systems, as well as in the Job Properties user interface.

Windows clients - Fiery Driver 6.3

Fiery Driver version 6.3 offers a highly improved user experience with a modern design that is consistent with Fiery Command WorkStation 6.

Print settings' sections are presented vertically with sidebar navigation tabs that take less space and expand the print settings area to minimize scrolling down to find settings.

Fiery Driver 6.3 also complies with:

- EV Signature, Microsoft's more stringent code signing certificate requirement

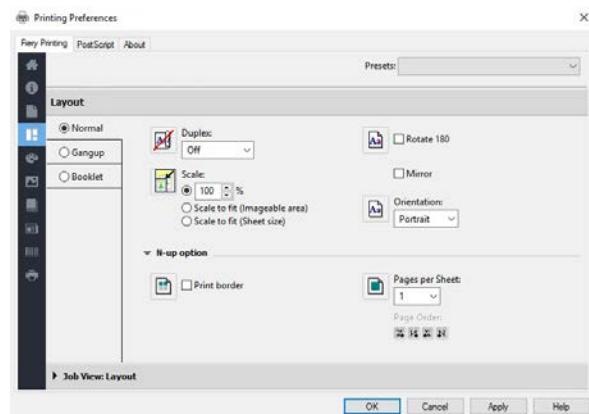

- Command line installation that enables the use of enterprise deployment tools

For Windows clients, users no longer need to access print properties to find the duplex or "Print on both sides" selection. The duplex setting can be found in the application's print dialog.

Fiery Driver 6.3 fully supports HiDPI monitors, following the Microsoft Windows display scale and layout settings, so fonts and other items can be scaled at a different size to the overall display resolution.

Supported operating systems include Windows 7, 8.1, 10, Windows server 2008 R2 and higher.

To download the latest Fiery drivers for your print engine visit [this web page](#).

Fiery Driver 6.3

Apple clients - Fiery Driver 6.5

The Fiery Driver in Fiery FS400 Pro servers has been upgraded to version 6.5 for Mac that offers a highly improved user experience with a modern design that is consistent with Fiery Command WorkStation 6.

Fiery Driver 6.5 adds support for macOS Catalina (10.15) and macOS Big Sur (11)

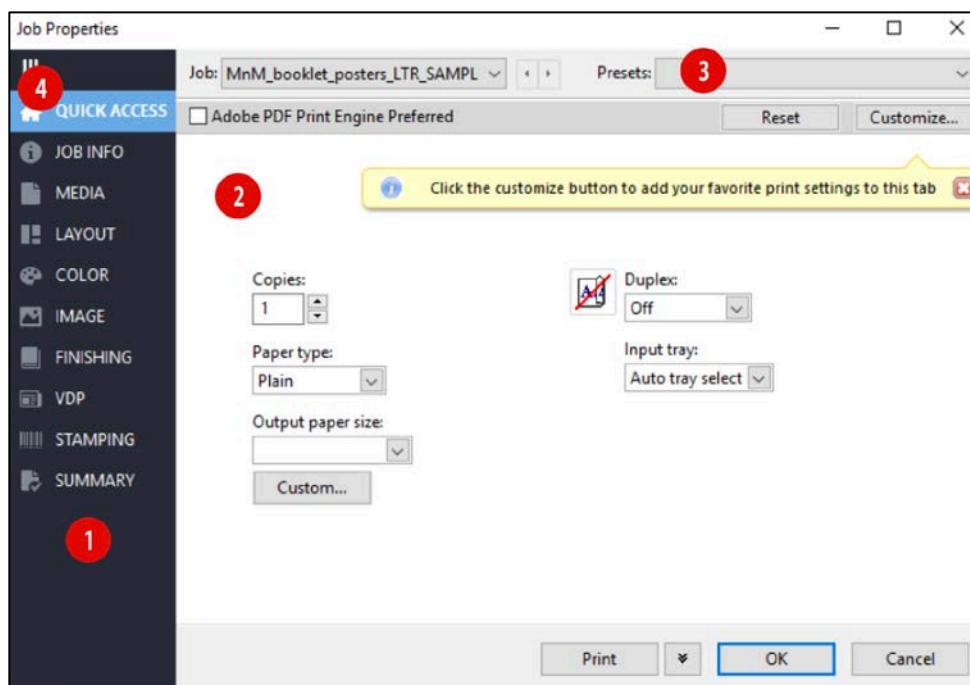

To download the latest Fiery drivers for your print engine visit [this web page](#).

User interface

The simple-to-use user interface (UI) presents the quick access tab with the basic printing options most commonly used in a distributed print environment. For more advanced users, printing options are categorized into tabs based on an user-centric model.

Clicking on any of the icon tabs (1) displays the options for that PPD category in the main active area (2). Up to eight options can be displayed at any time. When a category has more than eight options, users see a scroll bar to show all the available print options.

Fiery FS400 / FS400 Pro print servers – Product guide

Presets (3) allow the user to save predefined print settings as a retrievable template. The templates let users define settings based their own common printing scenarios. Administrators can also create Server Presets, and share those settings with Fiery users.

A customisable, quick-access tab (4) allows users to quickly and easily access the PPD settings use most often in their particular workflows.

Available for Windows and Mac platforms, Fiery drivers provide consistency across all supported client platforms.

Mixed Media settings

Users select the Fiery Mixed Media settings directly from the Fiery driver and Job Properties, and specify various finishing options and media types for certain sections or chapters. The feature also integrates with other features such as VDP and Fiery Impose.

Benefits:

Tools are easy to use and integrated with the entire Fiery workflow, reducing bottlenecks and user errors

Fully automated process digitally prints finished documents with minimal user intervention using Mixed Media, subset finishing, and tabs

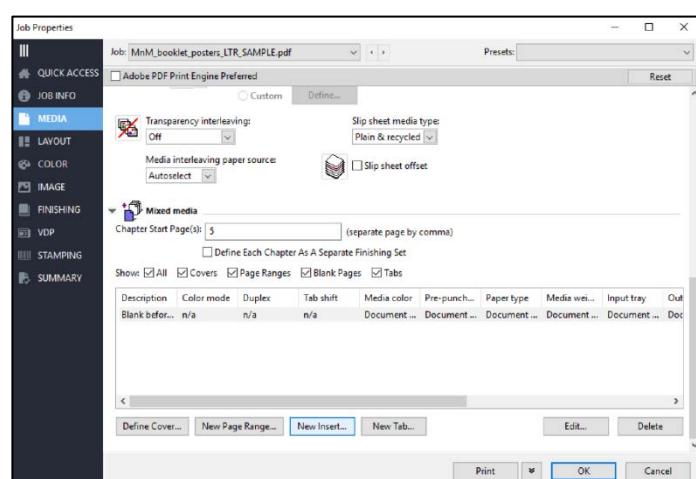

Consistent workflow for traditional and VDP jobs

Mixed Media viewer for perfect binding

Mixed Media viewer for perfect binding gives users visual feedback for page-level operations such as duplex, media, insert, and spine settings for a perfect-bound job. With this, users will understand the pagination implications of specifying these settings.

Users can specify multiple types of media for perfect-bound books. Plus, it automatically handles pagination so that perfect-bound jobs with different media print as expected. It shows users how a spine is included as the last page of the document.

The viewer adds a mixed-media interface directly into the perfect-binder user interface, and a

Fiery FS400 / FS400 Pro print servers – Product guide

wireframe mode to the perfect-binder mixed-media interface — giving users quick and easy visual feedback. Mixed Media viewer for perfect binding is available as long as the engine has a perfect-binder finishing option installed.

Benefits:

Gives the user precise controls over pagination

Provides quick and easy visual feedback for the following settings:

- Which page in the document is used for the spine
- The reading order of the rest of the pages of the document (when page-level duplex settings are used)
- The pages that are affected by a media definition

Tab Shift

Most software applications allow only a single page size within a document (Word, Acrobat, and InDesign are exceptions). The Fiery system provides the ability to shift certain pages one-half inch horizontally. This makes it possible to print the predefined tab text on the tab ear when tab pages are already included in the source document.

The user must precisely orient the text on the page, predict the ear position, and specify the page number that should be shifted. The Tab Shift option is in the Mixed Media settings in Fiery Compose.

Benefit:

Makes it possible to print the predefined tab text on the tab ear

Insert Tabs

In digital production environments, each user tends to perform specific tasks in a digital-document “assembly line.” Typically, in this type of setting, the same user makes media and tab placement decisions at the same point in the workflow.

With this in mind, the Mixed Media windows and Insert Tabs functions are tightly integrated into one workflow for ease of use and maximum user productivity.

Insert Tabs allows the user to create and insert tabs directly into documents on the Fiery server. The user inputs the text for each tab and specifies the location of the tab within the document.

This feature is standard for all Fiery external servers.

The user can define:

Number of tab ears in a bank. A single document can use multiple banks; a bank is typically composed of all the tabs necessary to run the length of the edge of the media.

The tab media. Users select the media type, paper size, paper source, and paper catalog.

Tab sequence (forward/reverse). This specifies whether the first ear of the tab bank is the first ear printed on (first to last), or the last ear of the tab bank is the first ear to be printed on (last to first).

First tab indent. Here, the user specifies the distance (up to 4.000 inches or 101.6 millimeters) between the edge of the media and the edge(s) of the first (and last) tab ear in the tab bank.

The output destination for unused tab ears in the tab bank. All unused tab ears in a bank are ejected to this output destination.

Multiple sizes of text in a tab ear.

Print facilities that require additional features to provide visual feedback and advanced tab insert functions can upgrade to Fiery Compose or Fiery JobMaster. For more information visit efi.com/fieryjobmaster.

Benefits:

Enables users of digital print engines to take advantage of fully automated digital printing processes, producing finished documents with minimal operator intervention, and reducing the need for additional resources while increasing capabilities and overall productivity

Allows users the flexibility to add tabs (and text in tabs) at the last possible stage in the print submission process

Fiery FS400 / FS400 Pro print servers – Product guide

Increases productivity by outputting documents ready to continue the finishing process. Shops don't need to manually discard unused tabs in each document set. (Device-dependent feature)

Define covers

Selecting the define cover button on the Mixed Media tab in Job Properties gives users the ability to quickly define the front and/or back cover of the document, without needing to know the total page count of the document. Users can specify whether to apply the same settings to both the front and back cover, or to use separate settings for each. The settings for covers are available in the page/page range media dialog box, and (engine-dependent) the Cover Page Mode option.

The Cover Page Mode offers three options:

Print on outside: A document page prints on the outer surface of the cover, while the backside of the cover (the inner surface facing the body page) is left blank.

Print on inside: A document page prints on the inner surface of the cover, while the outer surface of the cover is left blank.

Print on both sides: The cover is treated as a normal duplex sheet.

Benefits:

Provides a quick way to make additional customisation at the last possible production stage

Increases productivity by shortening the job setup and applying automation to complex job definitions

Decreases waste by automating complex finishing settings

Media Defined Profiles

Fiery servers offer various ways to select the output profile from the Fiery driver or Job Properties on Command WorkStation 6. If the Output Profile option is set to Use Job Defined Settings, the Fiery system's Media Defined Profile feature automatically applies the colour profiles defined for that particular media. For mixed-media jobs, it determines which profile to use for each media from the media settings in Job Properties.

When the user selects media in Fiery Paper Catalog, the feature automatically applies the correct profiles for the media. It also supports media with different profiles for each sheet surface, specifying the correct profiles for front and back independently.

Benefits:

Provides the most accurate colour output for mixed-media jobs with media-driven colour profiling

Offers easy-to-match colour profiles for each media through the simplified interface, for best quality colour output

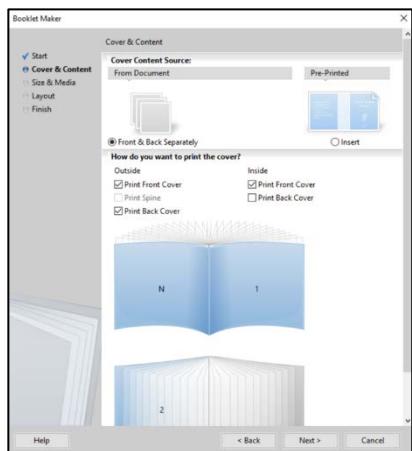

Booklet Maker

The Fiery Booklet Maker is an imposition tool in Job Properties that comes standard with all Fiery servers that allows users to print multiple pages of a print job, from any software application, in a booklet style — without the need for more advanced imposition programs.

The interface in Booklet Maker is interactive and intuitive to help users achieve the expected printed output every time.

Booklet Maker provides a visual and interactive way to specify the page number of the source document for cover pagination, so it can correlate the correct page numbers with the correct cover pages.

Fiery FS400 / FS400 Pro print servers – Product guide

Easy-to-use Booklet Maker interface

Benefits:

Produces sophisticated results with a simple operation

Intuitive UI minimizes training requirements, and a graphical and intuitive wizard-based interface guides the user in setting up professional-looking booklets more quickly and with fewer errors

Meets basic imposition requirements, with an upgrade path to Fiery Impose for expert users

Support for offline finishing

Fiery FS200 and FS200 Pro servers offer more flexibility by adding three settings in Job Properties that define online finishing options on a per-job basis.

Slip sheet

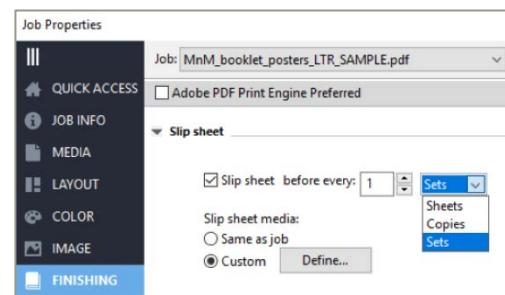

The slip sheet setting allows users to inject blank or preprinted sheets between sets, or within sets as separator sheets. The slip sheet is typically pulled from a tray loaded with different media to make it easier for users to see the breaks in the job. This feature also handles interleaving of various media, including transparencies.

Users can choose from these slip-sheet boundary options:

Sheets – inserts a sheet before a set number of sheets

Copies – inserts a sheet before a set number of copies

Sets – inserts a sheet before a set number of variable data printing (VDP) records, subsets, chapters, or uncollated copies (for example, 10 copies of page 1) of a job

Slip Sheet setting in the Finishing tab of Job Properties.

Job cover page

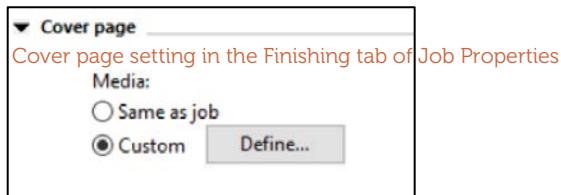

The job cover page prints a cover page containing job information after the last sheet of the job. This gives users another way to better identify the beginning and the end of a job and additional job details.

This feature is also available in Fiery Configure, in case administrators require all jobs to print with a cover page.

The job information in the cover page is predefined, and cannot be modified by the administrator.

Cover Page

Fiery FS400 / FS400 Pro print servers – Product guide

The job cover page includes useful job information for better identification of the final output.

Offset by sheets, copies, or sets

The Offset feature shifts the placement of the output during printing, so that the job can be separated into multiple parts more easily after printing.

The output can be offset for copies, sheets, or sets:

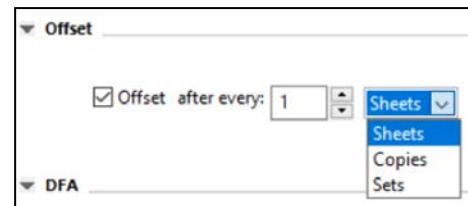

Sheets – offsets after a specified number of sheets

Copies – offsets after a specified number of copies

Sets – offsets after a specified number of VDP records, subsets, chapters, or uncollated copies (for example, 10 copies of page 1) of a job

This feature is also available in Fiery Configure, in case administrators require all jobs to be offset between jobs.

This feature is only available for print engines that have an offset option at the inline finisher.

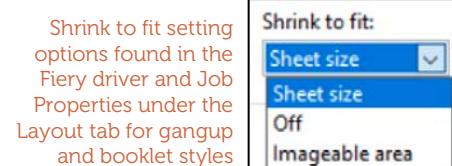

Offset setting in the Job Properties' Finishing tab.

Shrink to fit enhancement

The Shrink to fit setting in the Layout tab of the Fiery driver and Job Properties, ensures that the entire image on a page fits on the printed sheet. This enhancement offers users a choice when selecting the setting:

- Sheet size: scales the image to the sheet size of the selected media
- Imageable area: scales the image to the printable area of the sheet

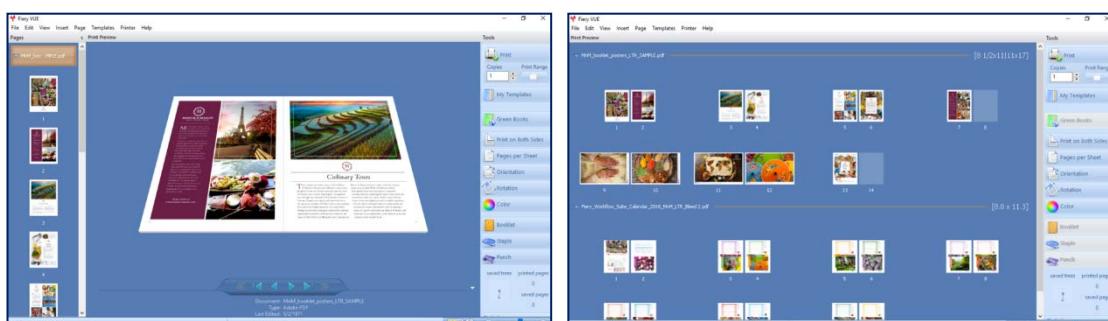

Benefits:

Helps users better define shrink-to-fit parameters

Avoids missing image data from printed output

Fiery VUE

Fiery VUE is a free, visual print application that produces professional-looking, finished print materials quickly, easily, and cost-effectively from desktop PCs. The interactive application comes with a user-friendly 3D interface that visually guides the user through document creation with intuitive layout and finishing tools. The environmentally friendly solution also reduces the eco-footprint by minimizing waste and using Fiery VUE Green Statistics to monitor the ways a job can be produced to be more "green."

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery VUE runs on Windows PCs and submits print data to the Fiery server. The documents developed in the Fiery VUE application can only be printed on a Fiery Driven print engine that is Fiery VUE certified.

If the Fiery Driven printers are managed in the corporate regraphics department (CRD) or in-plant printing facility, Fiery VUE can submit print jobs with instructions to the facility to meet even more complex production requirements.

The Fiery VUE settings are targeted at a specific Fiery Driven engine selected by the user, and only the printing and finishing options available on that engine will be presented for use.

For more information, visit efi.com/fieryvue.

Benefits:

Offers the most intuitive and innovative way to create professional-looking documents, right out of the box, with a visual user interface for power office users

Simplifies document assembly with drag-and-drop operations to combine or re-order Microsoft Office files and pages

Saves time and money with desktop document controls that produce customized materials in a short time

Reduces eco-footprints with the interactive 3D preview mode, Green Books auto-templates for booklets, and the new Green Printing Statistics which allows users to track paper savings by weeks and months

USB Media Server

USB Media Server provides an easy way to connect USB storage devices to the Fiery server and print files stored on those devices. New folders can be created on the storage device for automated printing.

Key features:

- Connect USB storage devices, including:
 - USB thumb drives
 - USB adapters for removable media (such as compact flash, smart media, and memory stick)
 - USB hard drives
- Fiery QuickTouch browsing capabilities on NX external servers such as:
 - Selecting file – Any supported file on a USB storage device can be selected.
 - Submitting file – Menu options below are available for submitting files after the user is in the Selected File mode.
 - Send to Hold queue
 - Send to Print queue
 - Send to Direct queue
 - Send to <virtual printer queue name>

Benefits:

Increases overall flexibility and enables walk-up users to easily print jobs directly at Fiery servers

Allows guest printing without network connectivity

Provides a number of easy and flexible ways to print files from USB devices

Paper Catalog

Digital document production tools demand a robust approach to paper management across the entire production environment. The ability to have an all-encompassing view of paper stock is essential in a successful document-production facility.

The Fiery Paper Catalog is a centralized paper database that stores attributes of the media stock at the production site. Users can access the feature from applications such as Command WorkStation, but the database resides on the Fiery server, where it is protected against server reboot or clear server actions.

Instead of defining media for each job (with attributes such as size, media type, tray, media weight, colour, etc.), Paper Catalog lets users define each media in the shop just once, and then select that definition for each job.

Fiery FS400 / FS400 Pro print servers – Product guide

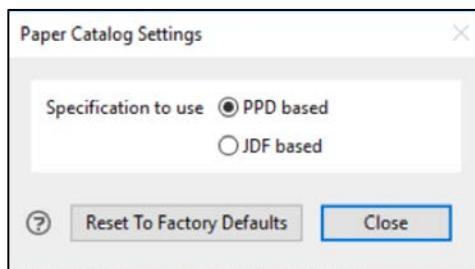

Paper Catalog uses the industry-standard job definition format (JDF) media attributes to define media, rather than printer/copier-specific media attributes. This makes automatic mapping of media definitions from modern job-submission workflows much more accurate. In addition, many of the attributes are the same displayed on the media packaging, making it very easy to define new media on the system. This reduces the number of times users need to configure the same media for the same job in different workflow steps. It also allows management information systems (MIS) to automatically collect production data from the Fiery server, tracking precisely how many sheets of which paper(s) were used to produce a job.

The media stock entries are stored in a database that:

Defines a name for each media attribute combination

Facilitates media selection at job submission by:

- Associating trays with loaded media stock
- Automatically using predefined colour profiles for each media (Media Defined Profiles)
- Facilitating a centrally maintained paper catalog
- Allowing PPD-based jobs and Paper Catalog-based jobs to coexist in the server

Paper Catalog settings use PPD specifications.

Key features include the the ability to:

Use printer (PPD)-based specifications mode

Publish/unpublish selected entries

Highlight what's loaded in the tray, plus display tray number and paper levels (Windows only)

Integrate printer/copier catalog into Paper Catalog

Export or delete selected entries

Associate colour profile for printer/copier catalog entries

Improve alerts and notifications

Benefits:

Simplifies media selection at job submission, reducing both manual steps and material waste resulting from incorrect media usage

Provides interactive feedback to reduce mistakes when associating paper stock to paper loaded in the trays, increasing overall production

Offers easy-to-relate colour profiles for each media through a simplified interface, for the best quality colour output

Translates the paper selection to the shop's classification system for paper stock, helping keep inventories up to date and reducing obsolescence

Provides an engine-agnostic approach to paper catalog management

Integrates use of Fiery JDF to reduce the number of times a user needs to configure the same media for the same job in different workflow steps

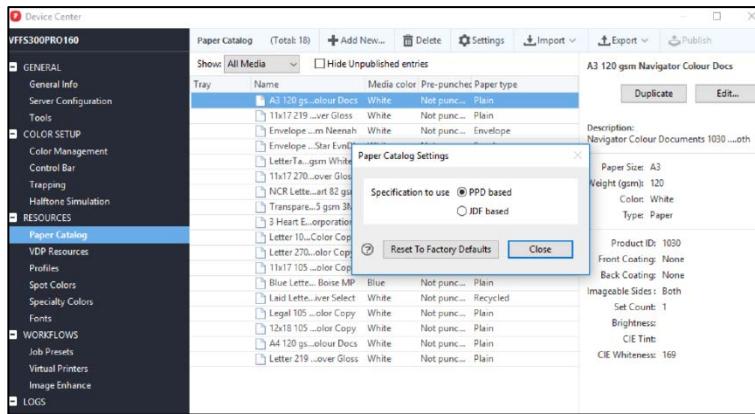

Paper Catalog based on PPD specifications

Paper Catalog on the Fiery server is a saved collection of attributes associated with specific media. Most frequently used attributes are paper type, paper weight, paper size, and colour profile.

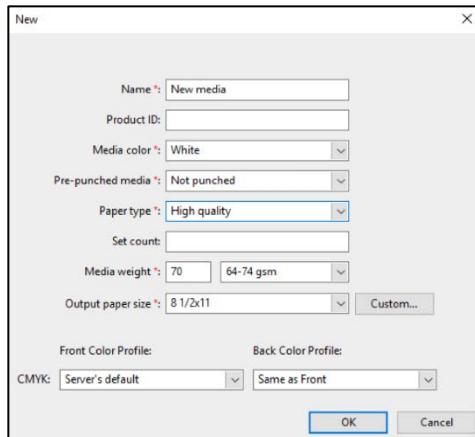

JDF media specifications can have over 35 different attributes per media entry in the Paper Catalog. However, customers can now also use Paper Catalog with non-JDF workflows.

Fiery FS400 / FS400 Pro print servers – Product guide

In this case, Fiery servers provide users with the choice to create a Paper Catalog based on the engine's media attributes or PPD definitions. This means users see only a few choices that are specific to their printer when adding and viewing Paper Catalog entries. This new simple mode is designed to make Paper Catalog faster and easier to use.

Users have the option to choose a simplified mode to input new entries in Paper Catalog.

Benefits:

Engine-driven media offers faster, easier setup

Setup is easier for non-JDF workflows

Paper Catalog for embedded servers enhances productivity

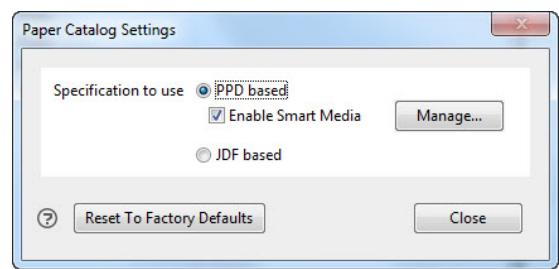

Administrators can now define some options when adding entries in Paper Catalog to enhance ease of use

Job Properties and bidirectional drivers can show which Paper Catalog entries are loaded in the printer trays

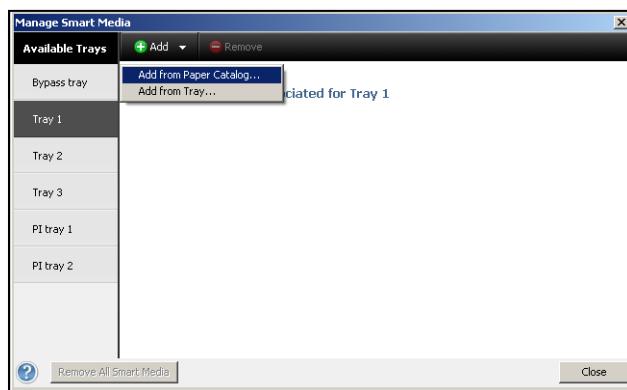

Fiery FS400 / FS400 Pro print servers – Product guide

Paper Catalog Smart Media

Smart Media is a feature designed to automatically assign a Paper Catalog entry, based on the characteristics of the media loaded in the tray. This feature is most beneficial for customers with a specific workflow that usually uses the same paper in the trays. Often, users stick the paper labels onto the trays to remind the users which paper to load. Smart Media allows the Fiery server to remember these favourite papers and perform an automatic tray association when any media with the same attributes is loaded in the tray. Smart Media Add from Tray pre-populates all properties for a new Paper Catalog media, using the tray attributes set by the end user. With this new enhancement, the user just has to load media into the tray and to name that media in the Paper Catalog. It's that simple. For the majority of users with a limited paper stock, automatically assigning media when loaded in a tray reduces the number of errors and improves media-based workflows. For office environments, for instance, users can now set up Paper Catalog so that tray 1 always assigns the correct Paper Catalog entry when a plain letter-sized media is loaded.

Smart Media is available when Paper Catalog is using PPD-based specifications.

Add Smart Media to a tray so it will be automatically assigned next time media with the same attributes is loaded.

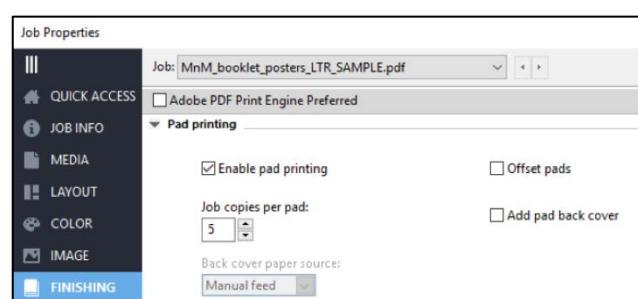

Benefits:

- Streamlines and simplifies the process of adding new media to Paper Catalog and saves valuable time
- Requires no additional steps to add a paper when a favourite (smart) media is loaded in a tray
- Increases reliability for media-driven workflows: minimizes errors when setting up media and user intervention

Pad printing

Pad printing gives users the ability to print multiple copies of a job without having to perform unnecessary mental calculations or multiple steps. Previously, the user had to multiply the number of pages in the pad by the number of pads, manually separating the pads after printing.

Job Property controls in the Finishing tab now let the user specify pad-printing parameters. The user can define the contents of each pad, including the number of times the job repeats within a pad. It duplicates a single-page job as many times as defined in the Pad Printing settings to create one finished/merged pad. Users can even add a back cover/slip sheet between each pad. Pad printing also allows users to simply assemble printed pads with a back cover, similar to sticky notes. Operators can use the Number of Copies control to specify the number of pads in the job. Pad copy packs are

Users can select the number of copies per pad.

Fiery FS400 / FS400 Pro print servers – Product guide

offset in the output tray for easy separation for offline binding. The feature is available for FS100 Pro (and later) Fiery servers.

Benefits:

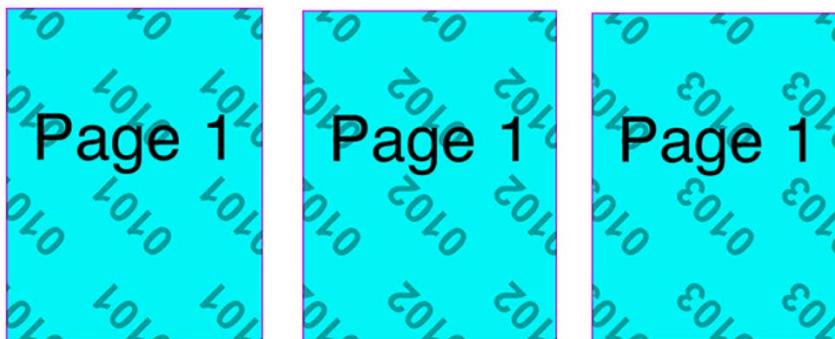

- Simplifies and streamlines pad printing
- Enables the user to create a pad easily from a single-page job
- Minimizes manual collation of the printed output

Copy Numbering

This feature provides the option of adding a simple copy number watermark that repeats over the pages of a job. It is useful for legal and government documents to provide identification, copy protection, and automatic consecutive numbering of pages.

The copy numbering feature is an entry-level version of the advanced numbering capabilities offered in Fiery JobMaster™.

Users can access the feature in Job Properties and save settings for future automated workflows using Fiery Hot Folders, job presets, and Fiery JobFlow™. Users can configure the angle, transparency, font size, and starting number of the watermark.

Three copies of a page with copy numbering:
Start number: 101, font: 100 pt., transparency: 35%, angle: 135°

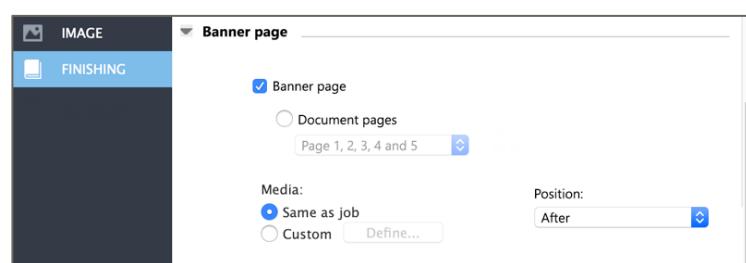

Document-based banner pages

Banner pages are a helpful resource that can help streamline the management of printed output and its distribution. These pages are printed right after a copy is done printing and facing up.

Document-based banner pages allows pages within a document to print as banner pages. This lets Fiery users customize the content of banner pages to fit their specific needs in output handling and distribution.

As the example illustrates on the right, the banner page can consist of more than one page, and have custom content such as barcode and a company logo. The first banner page can be sent to the Finance department for cost accounting purposes, while the other is used by the Shipping department for distribution instructions. The banner pages can print on a different media than the job and output on a different tray.

This feature is not supported for VDP or imposed jobs.

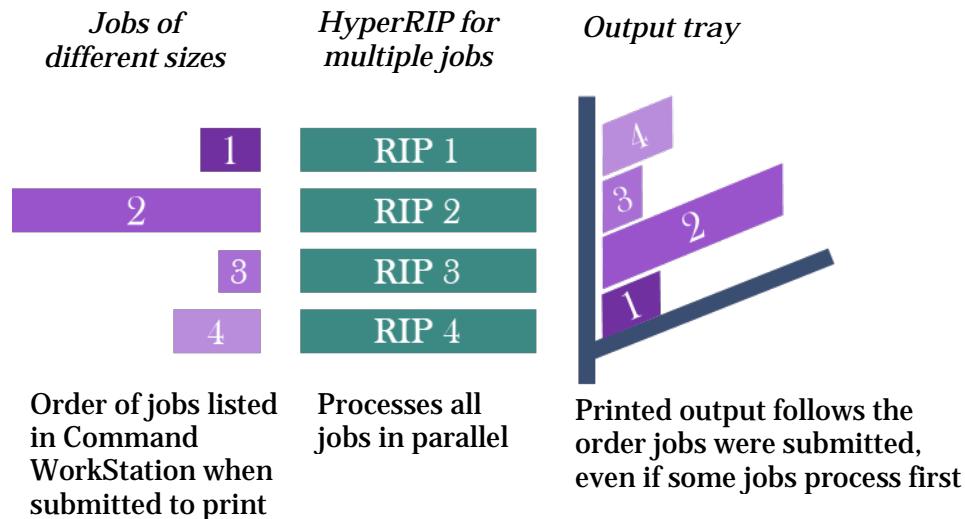

Banner page print settings

Strict ordered printing

This feature ensures jobs print in the order they are listed when selected to print from Command WorkStation. It offers a predictable order of the printed output to guarantee a streamlined finishing and distribution processes.

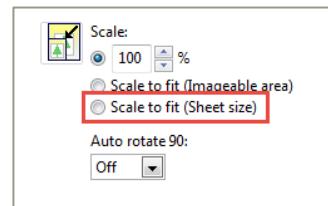

Advanced job management features such as Rush Print and Print Next can be used to override the strict order rule.

Scale to fit sheet size

The Fiery driver and Job Properties include a setting to scale the page layout to fit the sheet size, in addition to the imageable area.

This new setting allows printing full bleed when supported by the printer or maximizes the printed surface when the design has white background.

Setting in job properties and
Fiery driver

Fiery Remote Scan

Nearly all new documents today exist in digital form. Most corporate and print-production workflows are designed to handle digital documents efficiently. However, there are still substantial volumes of hardcopy documents that users sometimes need to include in their digital document workflows. Scanning technology is readily available in most commercial print shops or corporate in-plant and reprographics departments, but is not typically available to corporate workgroups where most of the content providers work.

The Fiery Scan utility brings document scanning capability to workgroups through any compatible output device with copier capability that is connected to a Fiery server. Windows and Mac users can create high-quality scans and specify destinations for the scanned files across a network.

The Fiery Remote Scan plug-in allows users to control the Fiery scanner/document feeder configuration remotely from a client workstation. The application runs on both Windows and Macintosh operating systems, and allows the user to initiate new scans.

All scans are initiated at the Fiery server and stored on the Fiery hard drive, so they are available for use and accessible from Fiery mailboxes. The Fiery server can also be configured as an input device for document-management systems.

Fiery Remote Scan incorporates auto discovery, making it easy to add networked Fiery servers to the list of available servers.

Benefits:

- Turns any Fiery Driven device into a high-quality scanner
- Reduces the need to store and track hardcopy documents, decreasing overhead costs and improving efficiency
- Provides flexible scan initiation options, including the copier scanner

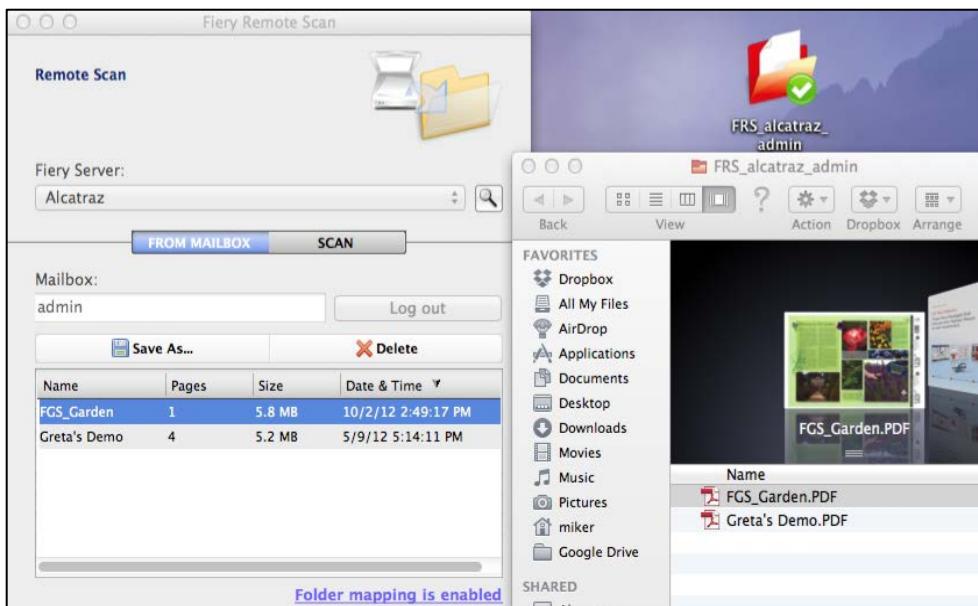

Fiery Remote Scan auto discovery

Folder Mapping

Folder Mapping allows users who scan from the Fiery server to synchronize the Fiery mailbox contents with a local folder. Folder Mapping is available on both Windows and Mac workstation clients. With this feature, the scan jobs going to a mailbox automatically appear in a folder on the user's computer.

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery mailbox contents are displayed on the Mac client.

Benefits:

Faster retrieval of scanned jobs

Windows and Mac support without the need to install additional applications

Fiery FS400 / FS400 Pro print servers – Product guide

Colour & Imaging

Fiery servers provide state-of-the-art imaging technology, combined with expert colour management tools, to deliver high-quality images with the accurate, consistent colour customers want.

Every Fiery server is PANTONE® Color enabled and comes with press-manufacturer-approved colour profiles for common printing stocks. These profiles are used to manage process colour output, and are also used to create spot-colour-matching tables for Fiery Spot-On, so that spot colours such as those from PANTONE libraries, print with the best possible match to the swatchbook.

Fiery Calibrator simplifies the process of re-calibrating the print system in order to deliver top quality and consistency for every job — even for reprints. Fiery Calibrator includes features such as the ability to use an ES-3000 spectrophotometer, job-based calibration, and Calibration Guard. In addition, users can take advantage of the print engine's inline measuring devices for calibration and profiling from Fiery colour management tools, making these routine processes run much faster and more efficiently.

Users can take late-stage image editing and correction to the next level with Fiery Image Enhance Visual Editor. This Command WorkStation plug-in allows print service providers to offer custom image correction services on the final PDF or PostScript print files.

The following table represents the standard configuration for each respective Fiery server platform and system version combination driving colour digital printers. *For information on a specific Fiery model's feature set, refer to the datasheet for that model, or ask your Fiery vendor about support for a specific feature.*

Integration with Adobe PDF workflows

Adobe PDF Print Engine (APPE)

Adobe's PDF-based RIP, Adobe PDF Print Engine (APPE), enables direct PDF RIPping without conversion to PostScript, avoiding potential errors for PDF files that contain transparencies.

EFI and Adobe have partnered to offer industry-leading print solutions by integrating the APPE PDF rendering technology with the Fiery server. By combining Adobe interpreter technology with a proprietary EFI software rendering engine, the Fiery server yields dramatically faster processing speeds for even the most complex files.

This support offers users a native end-to-end PDF workflow, and helps them improve the consistency and flexibility of the printed output from design to print.

With the support of APPE v5, Fiery NX server platforms achieve new performance efficiencies and breakthrough rendering features. PDF Print Engine 5 shares the same core technologies used in Creative Cloud applications, and has been updated and optimized for them. This guarantees consistency and reliability across proofing cycles, minimizing errors and the need for last-minute fixes. The v5.0 enhancements announced by Adobe can be found at: adobe.com/bg/products/pdfprintengine.

Fiery FS400 Pro servers include version 5.3 of the Adobe PDF Print Engine (APPE) interpreter. Version 5.3 adds support for the following features:

- Performance improvements with up to 5% faster processing
- Anti-aliasing for sharper edges
- Improved n-colour support
- PDF 2.0 ready

For additional information on APPE 5, visit this [web page](#).

Fiery servers offer extended support for APPE that enabled them to pass the Perfect PDF standards defined by the [VIGC group](#) in 2012. This is important to professional print providers. In addition, Fiery servers provide support for sophisticated print settings such as:

- Print Gray Using Black Only – to print any gray component of a job using only black toner, saving money for unnecessary colour clicks.
- Applying different halftones for text, graphics, and images – to optimize the image quality to those particular types of elements
- Fiery HyperRIP – to achieve dramatic performance improvements by processing multiple jobs or multiple segments of the job simultaneously
- Substitute Colors – to match brand colours in Microsoft Office documents

The APPE interpreter support is offered in addition to the conventional Fiery CPSI PostScript interpreter.

This dual interpreter configuration is standard for external Fiery servers shipping with Fiery Software System 9 R2 and above. This feature guarantees workflow interoperability. It also gives users the option to process PDF files using the APPE or conventional PostScript interpreter with a simple click of the mouse, and to meet the specific print output requirements.

Feature at a glance:

It supports PDF 1.3 and above; PDF/X-1a, 3, 4; and PDF/VT. (These formats also are supported in the PDF-to-PostScript converter with CPSI.)

Job submission methods supported include Fiery Hot Folders and File/Import from Command WorkStation.

CPSI and APPE workflows are simultaneously enabled, and users can choose between them.

Unlike other RIPs, Fiery servers have been offering the benefits of APPE for many years. The Fiery CPSI interpreter incorporates extensive and unique PDF capabilities to address the issues that designers and printers face today in producing creative, effective, and accurate documents. Because of this, there are

Fiery FS400 / FS400 Pro print servers – Product guide

few differences in the print results of APPE and Fiery CPSI interpreters. However, there are ideal print environments for APPE-enabled workflow, including the following:

- The print provider that uses a pure PDF workflow and requires PDF documents to remain device independent throughout the entire workflow
- The print provider that frequently prints designs containing transparencies, especially when the transparency interacts with black backgrounds
- The shop that wants to unify offset workflows operating with APPE with digital print workflows to ensure that the designer's intent is accurately reproduced on both types of press
- The print provider that prefers to perform job submission using Fiery Hot Folders or File/Import to Command WorkStation.

	APPE	Fiery CPSI
Supported file formats	PDF 1.3 and above; PDF/X-1a, 3, 4, PDF/VT v1 and v2	Same as APPE, plus: PostScript, TIFF, EPS, VDP (PPML 3, VIPP 8, VPS 1.5 , PDF/VT v1 and v2 compatible)
Job submission methods	Fiery Hot Folders Drag and drop to Command WorkStation FTP printing	Same as APPE, plus: Fiery driver Virtual Printers Email printing
End-to-end PDF workflow	Yes	CPSI accepts PDF jobs and converts them into PostScript. Although the job format changes, Fiery CPSI provides "what you see is what you print" results.
Full-fidelity desktop previewing	Yes, it reduces unwanted surprises and disruptive, last-minute prepress fixes in digital and variable print workflows. Jobs that include transparencies, mixed colour spaces, and layers are accurately reproduced.	Yes. Fiery CPSI is a PDF/X-compliant interpreter, which guarantees that the printed results are delivered under the PDF/X specifications. This feature ensures consistent print previews and proofs for VDP and non-VDP jobs.
JDF compatibility	Yes	Yes
PDF optimisation for VDP and non-VDP jobs	Yes It supports PDF/VT, the emerging standard format for VDP file exchange (ISO 16612-2), and enables caching of repeating elements.	Yes It supports PDF/VT, the emerging standard format for VDP file exchange (ISO 16612-2), and enables caching of repeating elements.

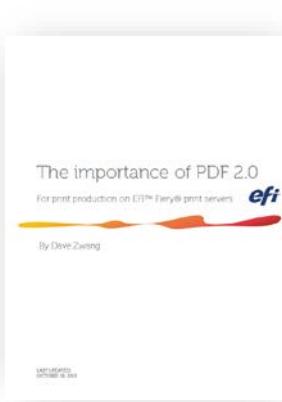

The new PDF 2.0 specification (ISO 32000-2:2017) is the successor of the PDF 1.7 specification (ISO 32000-1:2008). Relevant features for the print industry are:

The ability to process a PDF file with a different output intent per page, such as a single PDF file with a cover on a coated/glossy media, and inside cover pages on an uncoated media.

Object-based black point compensation (BPC) now lets users store a BPC for each object in the PDF file to provide better image quality control.

Supports the CxF/X-4, colour data specification, which includes how to store spectral data.

Better and more consistent support for transparency, and resolution of some unclear definitions in the previous specification.

Fiery FS400 / FS400 Pro print servers – Product guide

PDF 2.0 is a specification that supports a wide range of applications of PDF, and is not specific to print production. The new PDF/X-6 standard, based on PDF 2.0, will specify how to use PDF 2.0 in print production.

More information on the relevance of PDF 2.0 in print is available in this [white paper](#).

Benefits:

- Offers a comprehensive solution for job-management and job-preparation tasks
- Guarantees consistency in preview and print by supporting native PDF workflow from creation to final output
- Saves time by eliminating the need to convert or flatten content prior to submitting the job to Fiery server
- Uses the same files for offset, digital, and VDP — allowing the same PDF file to have a consistent output among print devices

Adobe PDF Print Engine option

This new option makes Adobe PDF Print Engine available to embedded Fiery servers based on the Fiery E⁴⁰⁰ or later hardware platforms. This support offers users a native end-to-end PDF workflow and enables them to improve the consistency of printed output.

In addition to this, embedded servers can process PDF/VT-1 files as efficiently as external print servers.

The Adobe PDF Print Engine option kit includes 4 MB of additional RAM.

CPSI 3020

Fiery FS400 and FS400 Pro servers provide support for the latest PostScript interpreter from Adobe.

Benefit

- Fiery servers keep customers up to date with support for the latest industry standards.

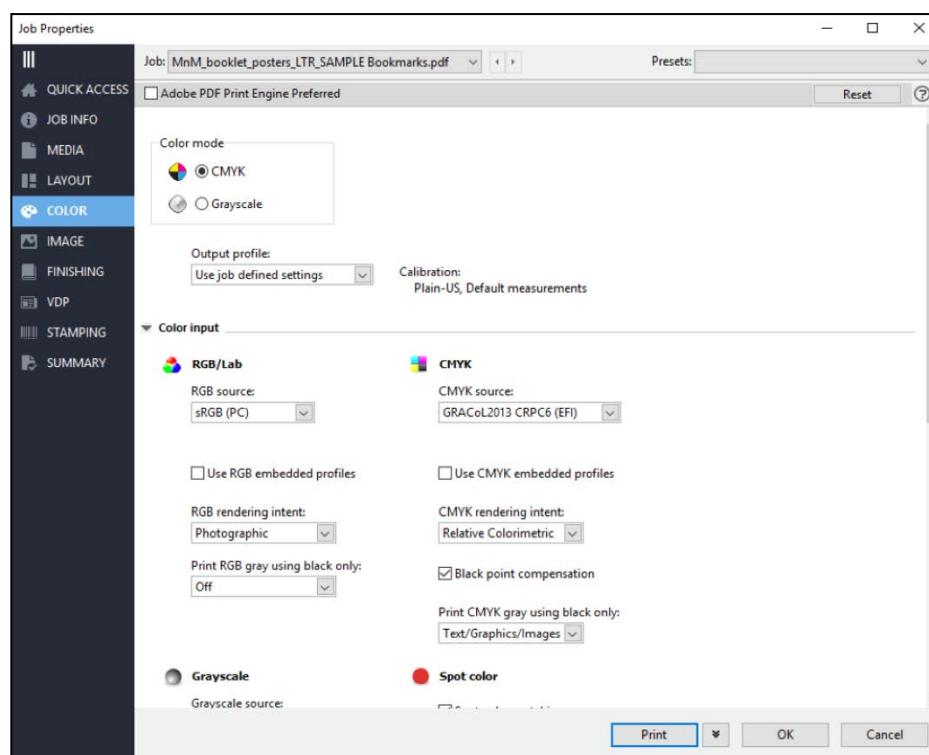

Colour management settings

Fiery colour management settings give the user maximum control over colour matching and matching to industry standards. Settings can be configured to accurately simulate conventional press standards, other toner devices, inkjet production print systems, or specific conventional presses. The colour management technology included in every Fiery server supports any input colour space including CMYK, RGB, spot colour, and device-independent. Controls allow operators to use embedded ICC source profiles, and to configure the system for perfect output of industry-standard PDF/X-4 files. Fiery servers deliver top-quality out-of-the-box colour, and have an intuitive and easy-to-use interface for configuring colour management settings.

High-precision ICC-based colour management

With Fiery servers, colour processing takes place only once, in RIP at the Fiery server – not at a client computer or prepress station. The process is fully automatic, so there is no need to manually configure colour management settings each time a job is sent to the print system. Fiery colour management technology doesn't rely on the skills of each press operator to configure colour settings. Once configured, the correct settings are applied consistently to every job. Fiery servers manage colour quality quickly and intelligently, and provide users the ability to automate colour workflows that run smoothly and consistently.

The Fiery colour features allow print jobs to be submitted faster, to free up client workstation(s) for greater productivity. Fiery colour management technology also allows customers to use any source software application or operating system, and supports virtually any file format.

Fiery colour setup in Fiery Command WorkStation

ICC-based colour management for precise colour matching

Fiery colour technology offers great out-of-the-box colour with features that colour manage source files to deliver stunning colour prints quickly, easily, and consistently. Fiery servers use ICC profiles for accurate colour printing from professional design applications, or from office software applications such as Microsoft Excel, PowerPoint, and Word. Users can select standard ICC profiles on the Fiery server for source colour spaces, and use top-quality factory output profiles for the type of paper the job will run on. The Color Editor allows users to edit the tone curves in Fiery output profiles to provide visual matching or correction if required.

Fiery FS400 / FS400 Pro print servers – Product guide

Benefits:

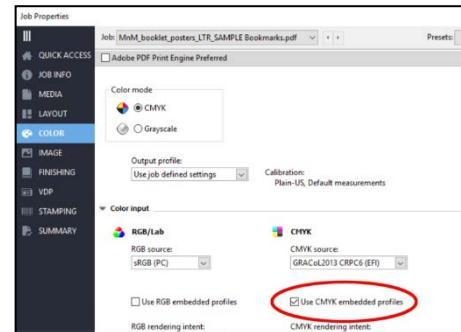

- Achieves maximum colour control
- Minimizes user errors with an easy user interface
- Provides excellent colour quality for professional digital colour production
- Shortens learning curves with intuitive controls and a unified interface with the Fiery print driver

Embedded profile override

Many applications offer ways to embed ICC profiles so that colours can be properly converted later in the workflow. For documents with a variety of colour spaces defined by separate colour profiles, Fiery servers are able to respect the source colour profiles embedded in a document. The checkbox, Use embedded profile when present, specifies whether the server should use embedded colour profiles or ignore them for RGB and CMYK sources.

Benefits

- Gives users the flexibility to handle a variety of input colour spaces based on embedded ICC source profiles
- Ensures that printed output will match the expectations of the document creator by using the embedded profiles in design documents

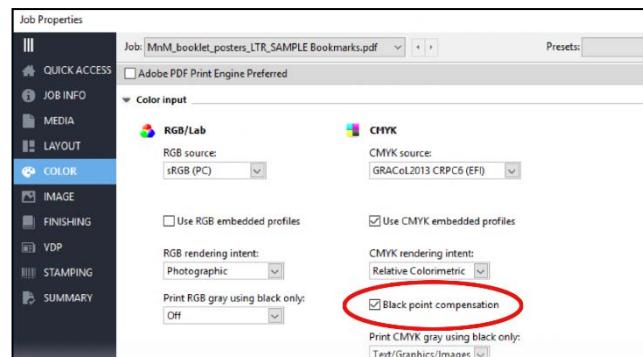

"Use embedded profile when present" setting in Job Properties

CMYK black-point compensation

CMYK black-point compensation uses Fiery colour management to control shadow detail when converting CMYK colours. This is especially useful for images with standard CMYK gamut sources such as ISO Coated V.2 or GRACoL. These are printed on low-quality media that deliver a smaller CMYK gamut, such as plain, uncoated paper.

When proofing small-gamut CMYK sources such as newsprint, users can disable the feature to more accurately render colours as they would appear with the reduced colour gamut of such a press. Black-point compensation is always enabled for RGB colour objects being colour managed with the relative colourimetric rendering intent.

Black point compensation setting in Job Properties and Fiery Driver

Benefit:

- Guarantees perfect PDF/X-4 output, or to pass the Altona and Ghent test suites
- Enables user to proof colour for small-gamut processes such as printing on newsprint

Fiery FS400 / FS400 Pro print servers – Product guide

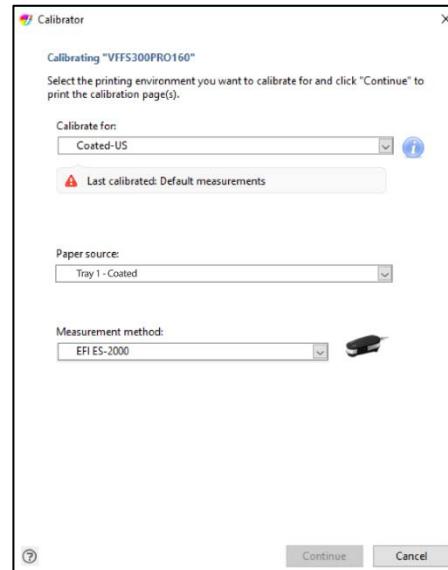

Calibration

Fiery Calibrator

Digital print engines are susceptible to gradual shifts in colour caused by changes in temperature and humidity, and fluctuation in CMYK toner or developer levels. To compensate for these variations, the print system needs to be calibrated back to a standardized colour appearance. Users can do this by re-calibrating for paper stocks at regular intervals, or before printing jobs with critical colour requirements. When the user re-calibrates, the Fiery server corrects for the current colour behavior of the print engine.

Fiery Calibrator gives more visibility into a job's calibration status, and allows users to see details of the calibration set for each paper stock — including the date the set was last calibrated. From Fiery Calibrator, users can also create calibration sets for new paper types. This is especially valuable if they are not using Fiery Color Profiler Suite for the end-to-end creation of a calibration set and output profile for a new paper.

For best results, Fiery servers should be calibrated with the EFI ES-2000 or ES-6000 device.

Fiery Calibrator

Benefits:

Increases colour consistency by calibrating for specific media

Saves time by allowing users to calibrate for the media they need at the time they need it

Helps operators achieve consistent print quality with a user interface that makes the calibration process easy

EFI ES-2000/ES-3000 and ES-6000

EFI recommends the ES-2000/ES-3000 spectrophotometer for calibrating Fiery Driven print systems. Using a spectral measuring device ensures the best colour precision, and takes just a few minutes. The ES-6000 is a network-connected scanning spectrophotometer that reduces the time and effort required to colour manage multiple print systems.

Benefits:

Provides best print consistency over time, so that reprints match the first time a job was run

Increases operator efficiency, since a control strip does not need to be placed on the print engine scan bed to measure calibration pages

Enables calibration for print systems that do not have an off-the-glass scanning option

Any user can calibrate

Administrators can increase productivity by letting any user calibrate. Because calibration functions are separate from management functions, administrators do not have to be concerned that an operator may accidentally change or modify system preferences or global settings.

Benefits:

Allows users to calibrate frequently and efficiently so that colour output quality and system productivity are enhanced

Ensures these same users do not have control over global colour settings for the print system

Calibration Guard

Fiery servers have the Calibration Guard feature to ensure that the calibration in use is current.

If a calibration has expired, Calibration Guard can warn the user or prevent jobs from printing to ensure colour consistency.

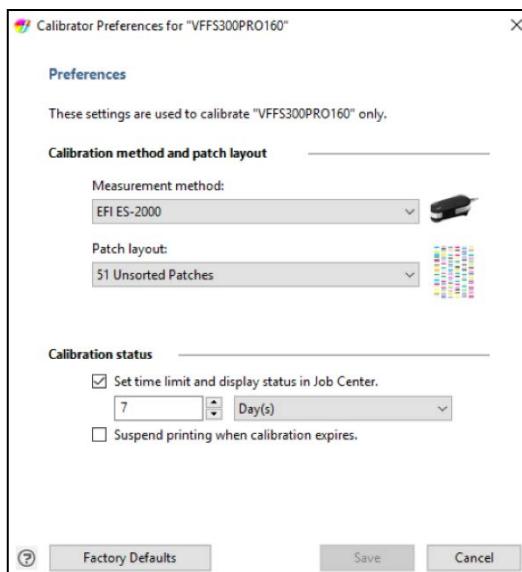

Fiery FS400 / FS400 Pro print servers – Product guide

To configure Calibration Guard, administrators enable the feature, specify the duration for which a calibration can remain valid, and whether to warn users or stop printing until they do a re-calibration.

Benefits:

Saves money and resources by not printing jobs with expired calibration

Forces users to calibrate at regular intervals, or printing is suspended until they re-calibrate

Set time limit and display status in Device Center setting in
Calibrator preferences

Job-based calibration

Job-based calibration increases accuracy and efficiency because users can be sure to re-calibrate for the calibration set used by a specific job. This is especially important for jobs that use non-standard media, because most users do not routinely calibrate special media. To calibrate for a specific job, users simply select the job in the Hold queue and select Calibrate. The Fiery Calibrator Wizard opens to guide the user through the calibration process, considering calibration for multiple calibration sets in jobs that use mixed media.

Benefits:

Improves colour consistency by re-calibrating for the specific media(s) a job uses

Increases efficiency as users calibrate the media they need at the time they need it

Fiery FS400 / FS400 Pro print servers – Product guide

Grayscale calibration

Grayscale calibration is a standard software feature for black-and-white Fiery servers, and requires the use of an ES-2000 or ES-3000 spectrophotometer.

Similar to colour calibration, grayscale calibration measures tonal variance from the desired target and compensates for the print engine variance when printing a job. On a regularly serviced engine, calibration will compensate for daily variances due to temperature, humidity, and paper stock.

Calibration provides consistency over time and ensures that a file printed today will match when reprinted. Grayscale calibration optimizes the dynamic range of the print system to render detail in images from the darkest shadow to the lightest highlight. It ensures that prints do not "plug up" in shadow regions.

Grayscale calibration can improve overall tonality, even on low-quality papers, and helps to reveal details for a higher print quality.

Before calibration

After calibration

Benefits:

- Maintains a precise match to the ideal tone reproduction
- Ensures reprints of a file match the original run
- Preserves and enhances detail in shadow areas

Inline measurement device support for calibration

Many cutsheet print engines include built-in inline measuring devices that can automatically measure colour patches, rather than manually measuring them after printing.

Fiery Command WorkStation supports these inline measurement devices for calibration and, in some cases, for profiling purposes making the routine calibration process much faster and easier.

This guide covers inline measurement for calibration. To learn more about profiling support, visit the Fiery Color Profiler Suite web page at www.efi.com/cps.

There are three types of inline measuring devices:

1. **Inline spectrophotometers** read colour patches on paper, return spectral measurements, and can be used for both calibration and profiling purposes.
2. **Inline scanners** and colourimeters read colour patches on paper and can be used for calibration purposes. In contrast to spectrophotometers, inline scanners can only return RGB values and therefore are not recommended for profiling or colour verification.
3. **Belt sensors** read colour patches on the belt, provide density measurements, and can perform automatic calibration updates that don't necessarily replace a recalibration process, but can maintain system calibration for a longer time.

Inline measurement devices can be used to:

1. Recalibrate

These calibration sets are also compatible with the EFI™ ES-2000 spectrophotometer or other instruments supported by Fiery Color Profiler Suite.

The recalibration process doesn't require the user to measure the calibration patches manually, making the calibration process much faster and simpler.

Fiery FS400 / FS400 Pro print servers – Product guide

2. Create new calibration sets

The calibration process with inline measurement devices offers a faster calibration process that doesn't require much operator training or skilled knowledge and reduces errors. In the case of inline spectrophotometers, it also doesn't require investment in additional measuring devices.

3. Automatic calibration updates

Some print engines without an inline spectrophotometer or an inline scanner can take advantage of their belt sensors to automatically update calibration sets with the current state of the engine, without any operator intervention. The update process is performed every time the engine requires self-adjustment. These automatic updates only affect the factory calibration settings (coated and uncoated).

All print engines have belt sensors that are used by the engine during warm-up, and for periodic self-adjustment procedures to bring engines back to a stable stage. Some belt sensors can retrieve and send measurement data to the Fiery server. With this data, the server updates its own calibration.

Automatic calibration updates offer the following benefits:

Produces consistent output for a longer time without the need to recalibrate as often

Print environments such as offices can rely on more consistent output without calibrating as frequently

The support of inline spectrophotometers and scanners for calibration is also available in Fiery Color Profiler Suite and doesn't require software licensing.

Consult your Fiery server user manual to learn the instrument support and capabilities for a specific Fiery server and print engine combination.

Inline measurement device support table

Inline measurement device	Recalibration	Create new calibration sets	Profiling	Automatic calibration updates
Inline spectrophotometers	Yes	Yes	Yes	N/A. Only by engine
Inline scanners Some models require a spectrophotometer such as ES-2000 to calibrate the RGB scanner for each paper type on first use and periodically thereafter.	Yes	Yes	Yes, but with limited precision	N/A. Only by engine
Belt sensors	N/A	N/A	N/A	Yes. Done by engine and synchronized with Fiery calibration measurements

Fiery Color Profiler Suite

Fiery Color Profiler Suite, a set of additional colour management tools, allows users to make custom calibration sets and output profiles for the specific press and paper in use. While factory-default profiles give pleasing quality, custom calibration and profiling provides the best colour precision to match spot colours and print industry standards. It extends the colour capabilities of Fiery Driven printers with the most advanced colour management tools available, and makes the process easy through integrated communication with the Fiery server. Fiery Color Profiler Suite offers modular functions, to ensure colour accuracy and consistency across all types of media while increasing productivity and return on investment.

For more information on the Fiery Color Profiler Suite, refer to efi.com/cps.

Fiery FS400 / FS400 Pro print servers – Product guide

Integration with Fiery Color Profiler Suite

Fiery Color Profiler Suite makes world-class display and output profiles for Fiery systems. Users can also create Device Link profiles using iterative measurement and optimisation technology to achieve additional precision.

Color Profiler Suite supports the EFI ES-2000, ES-6000, and a variety of third-party spectrophotometers. It provides tools that allow any user to create output profiles and linked calibration sets, verify colour precision, match multiple Fiery Driven engines, compare colour gamuts, and edit profiles. The suite is the only set of profiling tools that is tightly integrated with the DFE to make output profiles, spot-colour tables, and device link profiles directly on the Fiery server.

Benefits:

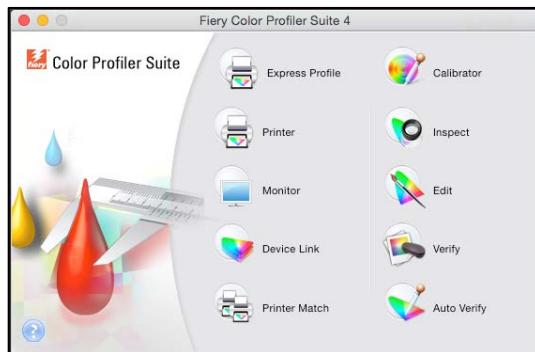

Create custom output profiles specific to your press, paper, and preferred print settings

Match industry standards such as ISO Coated v.2 and GRACoL more easily and precisely

Verify colour match to the reference from day to day

Improve spot colour matching by measuring samples and optimizing

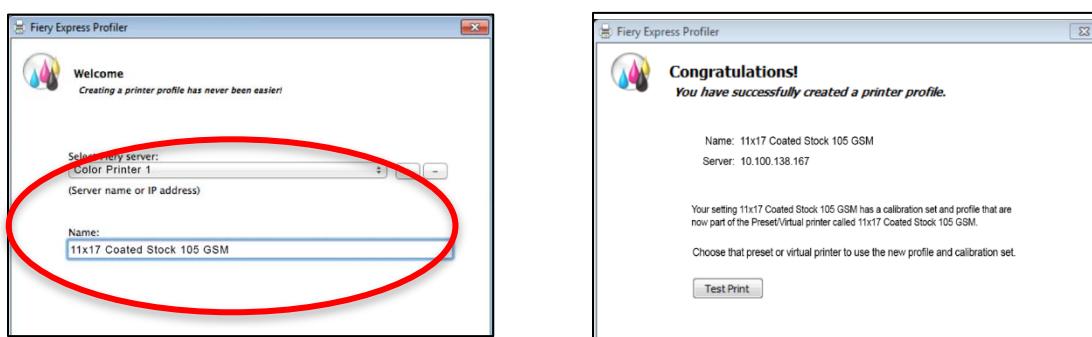

Create monitor profiles for softproofing.

Fiery Color Profiler Suite launch pad

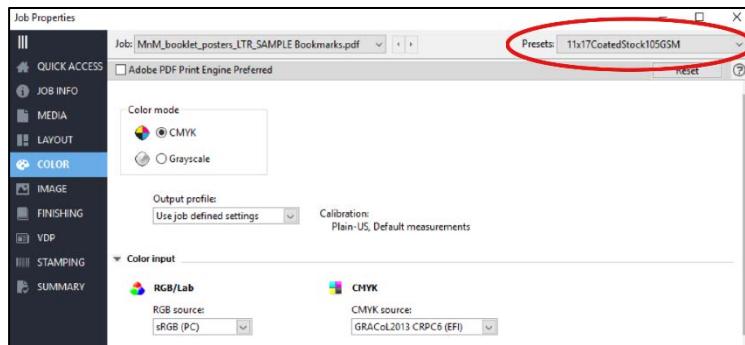

Fiery Express Profiler

The Fiery Express Profiler offers a simple five-step process to make a custom calibration set and output profile on a Fiery server. At the end of the profiling workflow, it creates a server preset and Virtual Printer to ensure the user can access the new profile and calibration, along with the print settings the profile was created for.

Fiery Express Profiler minimizes operator errors when selecting the correct profile and print settings for a job

Fiery FS400 / FS400 Pro print servers – Product guide

Use the same preset to ensure the use of the right output profile

Fiery Edge next-generation colour profiling technology

Fiery Edge™ is the latest and most advanced EFI colour profiling technology. Most Fiery FS400 Pro servers come with Fiery Edge ICC profiles pre-installed to deliver superior out-of-the-box results. Fiery Edge technology also provides more user controls when creating custom ICC profiles with Fiery Color Profiler Suite 5.2 and above, so users get the very best from a printer's capabilities.

Superior out-of-the-box results include:

- o Smoother colour transitions and blends
- o Enhanced shadow detail in neutral and chromatic areas
- o Better blacks for more dynamic range
- o More image definition, depth, and clarity
- o Better rendering of RGB images containing blues and reds

More controls with Fiery Color Profiler Suite:

- o Maximize shadow details
- o Create smooth colour-to-black transitions
- o Produce the best possible dynamic range

For more information, watch the [Fiery Edge video](#), or enroll for [Fiery Edge eLearning](#).

Fiery spot colour

PANTONE Colour-enabled

EFI and PANTONE® have a long-established partnership to provide the best spot colour tools and workflows for print providers. EFI offers the PANTONE Plus v.2™, as well as older PANTONE libraries, that users can load on Fiery servers. Loading the latest PANTONE libraries on a Fiery server ensures that spot colour output is accurate and consistent for all print jobs.

PANTONE Colour-enabled Fiery servers provide state-of-the-art matching of spot colours

PANTONE Colour-enabled Fiery servers automate the colour matching process from job submission to output. This automation eliminates guesswork and costly rework by controlling how colours will print.

The built-in colour lookup tables in the Fiery system automatically convert the PANTONE colour to optimized CMYK tints, based on the output profile for the paper that will be used. Operators can use Fiery Spot-On to further fine-tune the output of any PANTONE colour.

Using Fiery Spot-On takes the guesswork out of colour matching with an intuitive interface that makes it fast and easy to define or modify spot colours, eliminating the time-consuming task of making test prints to experiment with spot colour formulas. Spot-On reduces the potential for error by allowing users to create libraries of custom colours for use on other Fiery Driven print systems. The Substitute Colour feature lets users map colour tint substitutions for both CMYK and RGB source colours to correct spot colour tints and allow RGB tints from Office applications to be treated as spot colour when needed.

Spot colour libraries included in every Fiery server

PANTONE libraries: Includes the new PANTONE PLUS v.2 SERIES and PANTONE FASHION + HOME libraries

HKS, DIC, and TOYO Ink spot colour libraries: Includes the spot colours used in Europe (HKS) and Asia (DIC and TOYO)

PANTONE colour libraries and colour reference charts

The Fiery system currently supports a number of PANTONE colour libraries, including the following:

PANTONE PLUS v.2 Coated

PANTONE PLUS v.2 Uncoated

PANTONE FASHION + HOME

PANTONE PLUS v.2

Fiery FS400 allows users to reproduce even more PANTONE colours accurately, with new support for the PANTONE PLUS v.2 and PANTONE FASHION + HOME libraries. The PANTONE PLUS v.2 library provides updated colour definitions for legacy PANTONE Coated Second Edition colours, and additional colours included in the v.1 PANTONE PLUS libraries, the PANTONE 336 libraries from 2014, and additional colours added in 2015 and 2016 years.

Benefits:

Meets the brand-colour expectations of demanding customers

Properly matches the latest PANTONE colours, including new colourimetric definitions

Users can also download the full array of PANTONE libraries, including the updated PLUS SERIES of the PANTONE MATCHING SYSTEM® with 84 new colours, from download.efi.com/FieryPANTONE.

The screenshot shows the EFI website with a search bar for 'PANTONE'. Below it, there are several download links for different PANTONE libraries:

- PANTONE PLUS V3 Libraries (Coated and Uncoated)
- PANTONE PLUS Extended Gamut Library (Coated)
- PANTONE FASHION, HOME + INTERIORS Libraries
- PANTONE Formula Guide (2nd Edition) Libraries
- PANTONE Goe Library

The latest Pantone libraries are always available for download from efi.com

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery Spot-On

From corporate branding to high-level colour matching in commercial print settings, it's essential to print consistent, predictable spot colours the first time, every time. With the growth of digital workflows, more users are able to create and influence colour in documents. This new level of control does have drawbacks, such as the misuse of colour naming and callouts. These mistakes can lead to bottlenecks in prepress and proofing. Spot-On provides a world-class set of tools to address these problems and streamline colour print production for jobs that use spot colours.

Fiery Spot-On is a standard tool in all external and embedded colour Fiery FS400/FS400 Pro servers (with the exception of A series), and is often offered as an additional software product for embedded servers. Fiery Spot-On provides a graphical user interface to help zero in on the CMYK tints needed to match a desired spot colour on a given printer and media. It also lets users create custom spot colours with specific names. With Fiery Spot-On, users can achieve accurate colour matching for spot colours used in logos and branding with spot colour libraries such as PANTONE, HKS, TOYO, and DIC.

Fiery Spot-On delivers accurate colour matching for corporate and other spot colours more easily and quickly than competing colour editors.

Built-in spot- and substitute-colour capabilities

Fiery Spot-On offers a number of sophisticated capabilities for spot-colour matching, including:

- Enables the user to edit spot-colour conversions in order to better match a customer's preference
- Allows users to create and manage new spot colours and collections of spot colours
- Captures new spot colours using an ES-2000 spectrophotometer
- Provides tools to visually select a better match to a desired spot colour

Spot colour management

Fiery Spot-On allows users to edit CMYK tints associated with named colours, so they can achieve better colour matches. It provides a graphical user interface to help the user zero in on the exact CMYK tints needed to match a desired spot colour for a given print condition.

Spot colour group priority

Spot colour group priority enables users to easily ensure that custom spot colour representation is honored, to satisfy customers' expectations.

This is very useful for print providers that frequently edit the appearance of specific spot colours to match the expectations of print buyers. These spot colour edits are saved as new groups of colours using the Spot-On interface in Device Center.

The spot colour group priority feature allows users to set which of the colour libraries in Spot-On takes priority for a given job from the Color tab in Job Properties or Fiery driver. This means that, if the requested spot colour adjustment for one customer is created in a custom spot colour library, the library can be given priority when printing that customer's jobs — without forcing the spot colour edit for all future print jobs. This is also beneficial when print providers have multiple customers requesting different edits to the same spot colours.

This feature can save a lot of time because users don't need to constantly check the order of the colour libraries or groups in Spot-On.

Define color library order by job with spot color group priority

Substitute Color

The Substitute Color feature allows users to achieve spot-colour consistency across documents to maintain brand colours. Because it can be used with RGB colours in source documents, it allows organisations to establish company-wide RGB colour palettes for Office applications that don't support spot colours.

Benefits:

- Delivers accurate and simplified corporate colour matching from Office applications

Fiery FS400 / FS400 Pro print servers – Product guide

Allows late-stage spot colour correction and replacement for spot colours that were converted to process in error when producing the print job

Eliminates spot colour rework with late-stage colour editing, without opening the native application files

For more information about Fiery Spot-On, refer to the white paper, [*Fiery Servers: The Easiest Way to Get the Right Color Every Time.*](#)

Specialty colour support (engine specific)

Specialty Colour lets operators use custom-output-device colourants or special effects. This includes clear coatings, white colourant for printing on specialty media such as metallic substrates, and specific colours such as neon colours or metallics.

Specialty colours can be applied in the original design file, then managed on the Fiery Driven print system to enable the use of specialty colours available at the print device. Fiery Specialty Colour controls can also be used on jobs for which specialty colours were not defined in the original document. Controls allow users to flood coat entire pages with a specialty colour such as clear, or to apply the specialty colour to specific page object such as images, graphics, pre-defined spot colours, or fonts.

Users can also automatically apply specialty colours as a watermark. This automatic generation of specialty colour watermarks is unique to Fiery servers.

Refer to the Fiery user manual for print engines that support the Specialty Colour capability for more information.

Benefits:

Printers create can higher-value output with customized special effects, right from the DFE

Graphic designers can create documents that stand out from others, using special effects for highlighting

Users can apply flood coat and image varnishing to files without having to define the varnish plate in the design file

Image quality optimisation

Fiery Image Enhance Visual Editor

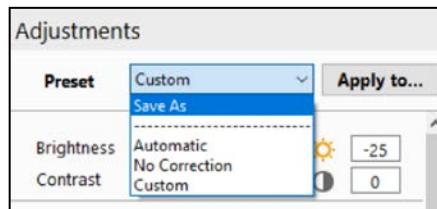

Image Enhance Visual Editor is a Command WorkStation plug-in for adjusting images in a job, without the need to open the file in the originating application. This feature is standard on external Fiery servers, and part of the Fiery Productivity Package for embedded Fiery servers. It enables real-time image editing, and eliminates the need for additional image-editing software. Image Enhance Visual Editor works with both PostScript and PDF files.

Image Enhance Visual Editor presets allow novice users to apply expert image enhancements and save custom enhancement configurations. These presets can be assigned to a specific range of pages in the current file, or to other files in the future. The default preset, called Automatic, will analyze and automatically enhance the image quality for a variety of imaging problems. More advanced users can manually adjust tone, colour, and image sharpness. Users can see image adjustments before they save changes.

Before Image Enhance Visual Editor

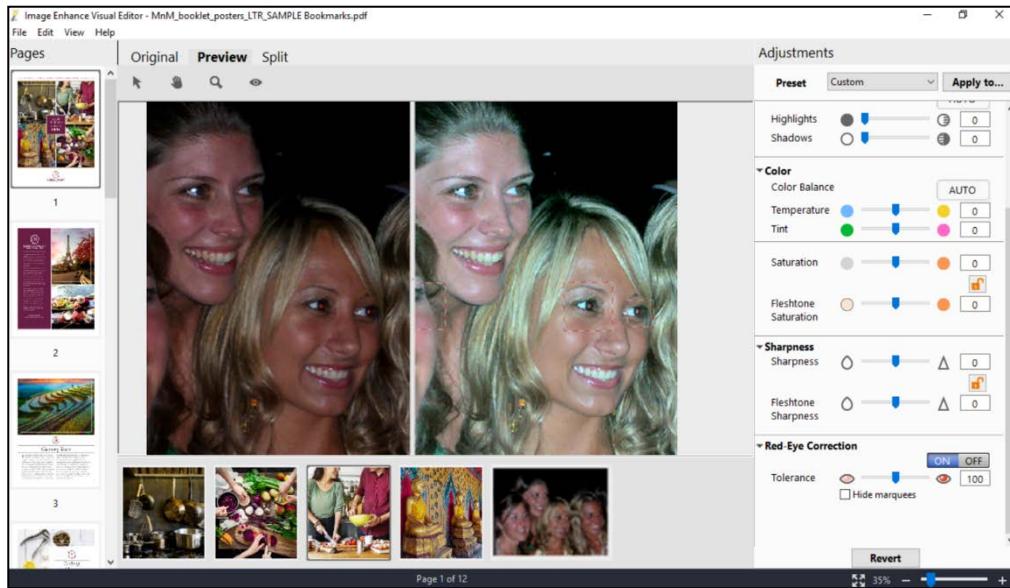

After Image Enhance Visual Editor

Users can save custom image-correction settings to reuse in other images.

Image Enhance Visual Editor also corrects for red-eye. When users set red-eye correction for an image, they'll see a preview highlighting instances of red-eye in that image that will be corrected. Users can specify additional red-eye regions, or areas that don't need correction. These adjustments all appear in the onscreen preview so that the user can make the correction without wasting time and money by printing a sample.

Fiery FS400 / FS400 Pro print servers – Product guide

Users can select additional red-eye regions to correct, or deselect areas that don't need correction.

Once a user saves image-correction settings from Image Enhance Visual Editor in PDF files, the settings are stored in the PDF so that the user can fine-tune corrections later. This way, users can also reverse PDF file adjustments.

Image Enhance Visual Editor works with file sizes under 2 GB, documents less than 100 pages, and pages that contain fewer than 50 images. Additionally, the feature is designed to detect and enhance only natural images, so it won't affect bitmap versions of graphics such as charts and graphs. Image Enhance Visual Editor does not preview spot colours and inter-object print settings such as overprint or transparency. These remain in the original file so that they will be honored when printing.

Fiery Image Enhance Visual Editor addresses the widest range of images and jobs by supporting RGB and CMYK colour sources, and the most commonly used file formats. This makes it the most complete toolset of its type in today's market. It can be used to improve the image quality of many types of print jobs such as office documents, photo books, and professional publishing layouts.

Visit the Resources section at the Fiery Command WorkStation website at efi.com/CWS to watch the Image Enhance Visual Editor video demonstration.

Benefits:

Reduces turnaround time because users do not need to return to the originating software application to correct images

Saves money, because print providers don't need expensive image retouching software at every workstation

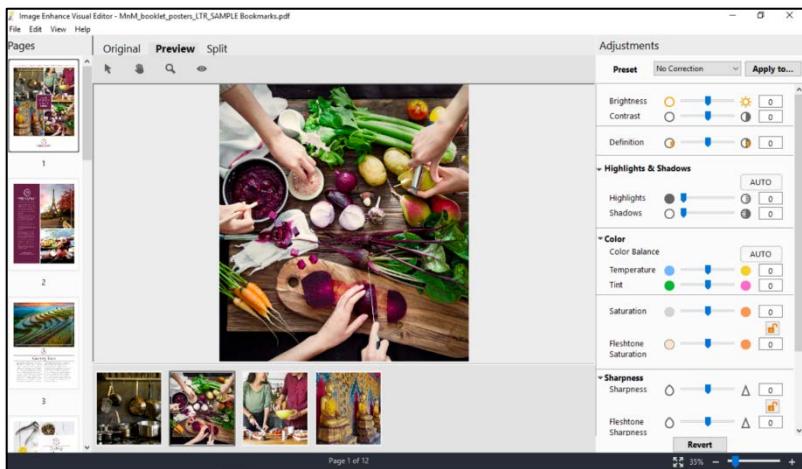

Corrects saturated colours without harming flesh tones

Allows users to fix images late in the production process after the job is already on the Fiery server

Makes it easy for any user to enhance images with automated tools

Image Enhance Visual Editor can be launched from Command WorkStation (highlight job, right-click).

Fiery FS400 / FS400 Pro print servers – Product guide

The Fiery Image Enhance Visual Editor definition and saturation controls

Fiery Image Enhance

Fiery Image Enhance improves the output quality of digital photos, and saves prepress time by eliminating manual image editing tasks. Image Enhance addresses the widest range of images and jobs, making it the most flexible feature of its type in today's market.

Image Enhance automates optimisation so users don't need to preview or tweak images before printing. Simply turn it on in Fiery Job Properties. It also works with Fiery Hot Folders, Job Presets, and Virtual Printers.

This feature is standard on all Fiery colour servers.

Key features:

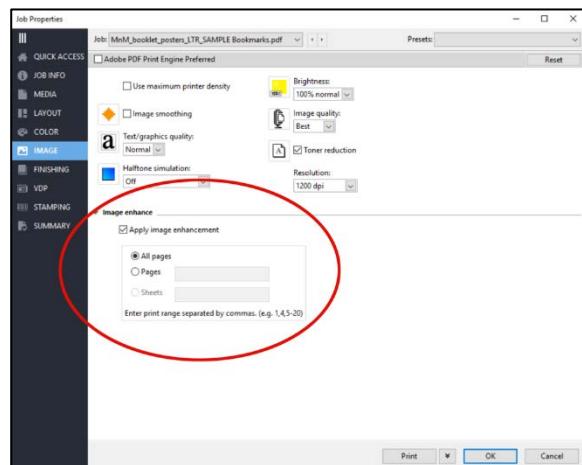

Automatically enhances images in submitted TIFF, PostScript, or PDF files

Corrects images based on settings configured in Command WorkStation

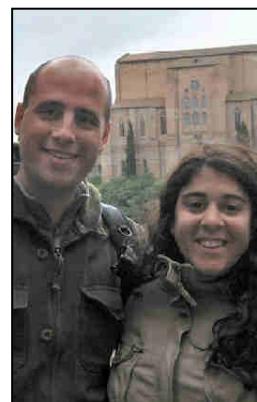

Features automatic correction modes that do not correct or affect images that do not require enhancement

Once configured and enabled, requires no user intervention to enhance images in every job produced

Reduces waste from jobs printed with less-than-optimal quality

Before Image Enhance

After Image Enhance

Fiery imaging features

Perfect PDF

External Fiery print servers offer APPE, the native Adobe PDF Print engine. Only Fiery servers have been awarded the designation of printing the perfect PDF by the VIGC group in 2012. Fiery servers with APPE perfectly print the Altona Technical Suite version 2, the Ghent workgroup PDF/X-4 test files, and the additional tests developed by VIGC — every time.

Benefits:

Ensures that prints match the designer's expectation, even if complex transparency effects have been used in the design applications

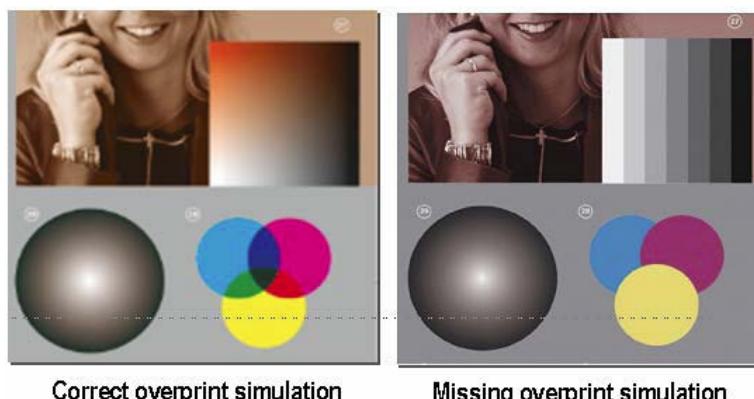

Optimizes shop productivity by moving to a 100% PDF/X-4 workflow so that print buyers submit files in the standard PDF/X-4 format and Fiery Driven print systems image them perfectly

Eliminates errors and delays in production that can occur when PDF files need to be manually flattened or printed from the print driver to get proper transparency blending without colour or imaging artifacts

Composite Overprint for spot colours and CMYK

When an object of one colour is placed on top of an object of another colour in a page layout or drawing, the object on top can be imaged directly on top if it has been configured to overprint.

Historically, users had to send pre-separated PostScript files to DFEs in order for overprints to render correctly on the printed output. This was not an optimal workflow for processing colour. It also led to many mistakes on the part of designers and print providers, and often to unsatisfactory quality.

Fiery server users can automatically enable the Fiery Auto-detect Composite Overprint feature for objects specified to overprint. This means that objects will be represented with the correct overprint simulation. It also eliminates the long processing times common on other DFEs when composite overprint is enabled. Use this feature for best results with all jobs except pure RGB files such as digital photobooks.

Benefits:

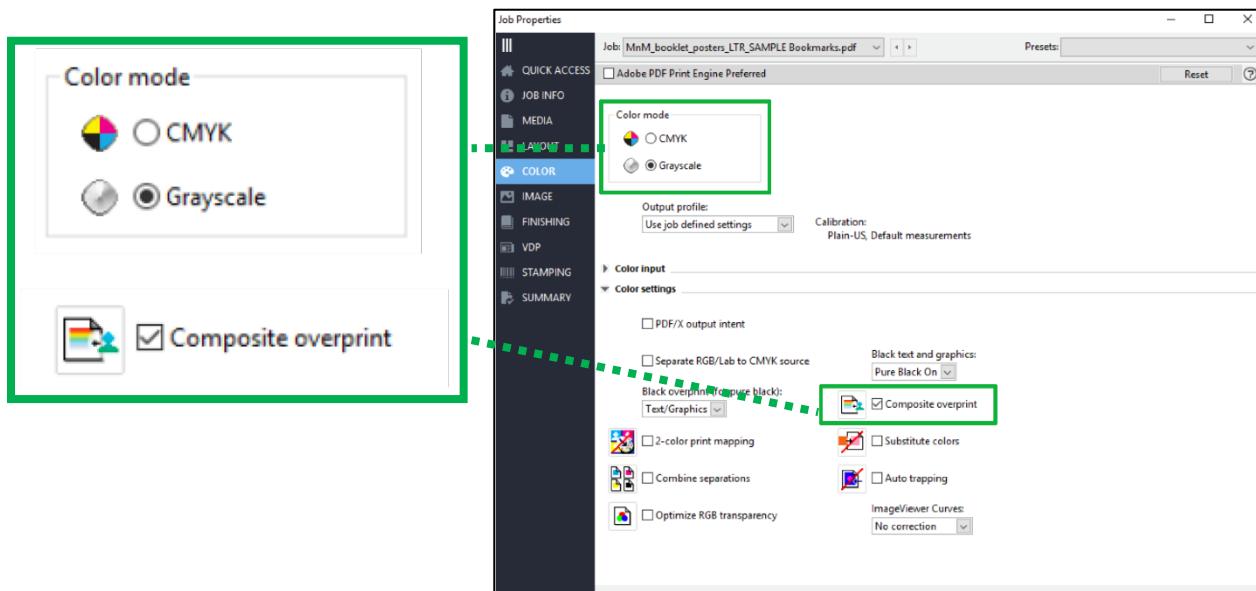

Further speeds up file processing times compared to competitors

Produces overprints specified in design applications for perfect printed results that match the designer's expectation every time

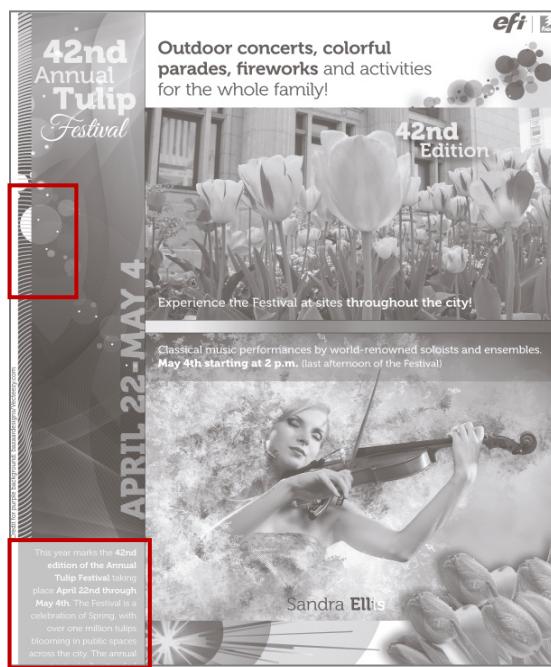

Grayscale Composite Overprint

The Grayscale Composite Overprint feature allows overprints, drop shadows, and transparencies in colour print jobs to render accurately when printing in grayscale mode on full-colour print devices. This unique Fiery feature works when printing in grayscale colour mode with the Composite Overprint setting enabled, and works for both CPSI and APPE interpreters.

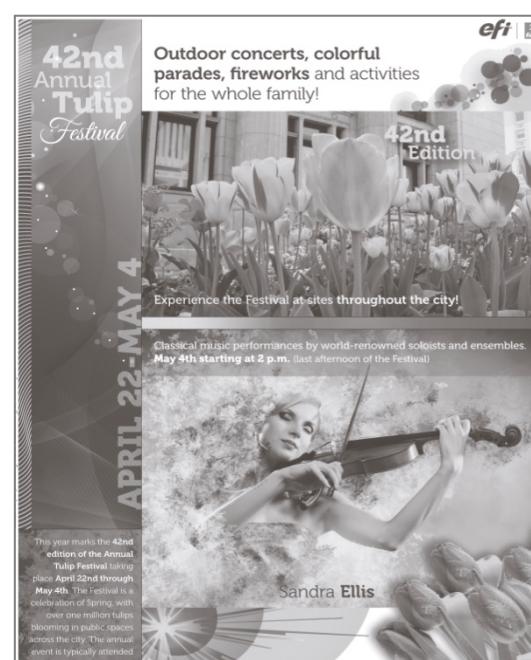

Fiery FS400 / FS400 Pro print servers – Product guide

Grayscale and Composite Overprint settings need to be selected in Job Properties to guarantee correct representation of overprints in black-and-white output.

Red boxes indicate where errors occur because overprint is not applied

With Grayscale Composite Overprint enabled

Benefits:

Guarantees black-and-white output that matches the design, even if the designer has used techniques such as overprinting

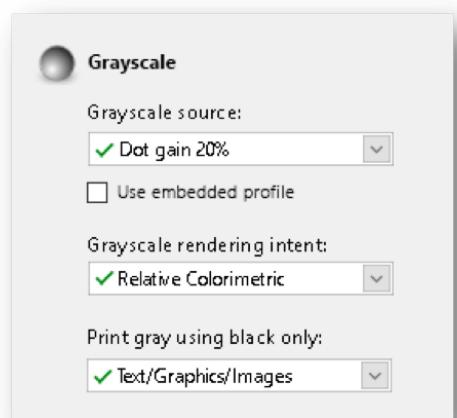

Saves click charges, while producing black-and-white output that preserves the appearance of complex design elements

Fiery FS400 / FS400 Pro print servers – Product guide

Grayscale input profile

The grayscale input profile provides specific control over the colour management of grayscale page objects by adding grayscale settings to the Color tab in Job Properties and the Fiery driver.

When grayscale page objects are created in a design application, such as Adobe Photoshop, a grayscale ICC profile is used to define their intended appearance. Now operators can set the same profile to be used on the Fiery server so that the expected appearance can be maintained when printing grayscale images, vector, or graphic objects.

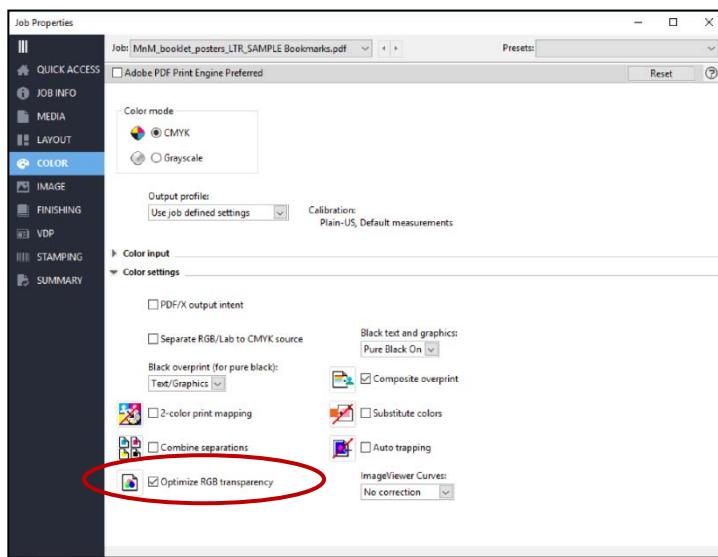

Optimise RGB Transparency

It's easy to create transparent page objects in modern design applications. Unfortunately, it's also easy for designers to accidentally cause problems when they use drop shadows or other effects that rely on transparency blending from these design applications. The definition of these transparent regions resides in the PDF document, and they are flattened at the DFE to improve productivity. Design applications specify the colour space used when blending transparent regions in the PDF. However, the Adobe APPE interpreter does not consistently respect the intended blending of colour spaces, and defaults to the same colour space for all jobs.

On the Fery server, users can enable the Optimise RGB Transparency setting at the Fiery driver or in Job Properties. This forces the interpreter to use the blending colour space specified in the PDF file, so that the output has no artifacts and matches customer expectations. This enhances the print quality of PDF files that include overlapping RGB elements defined with transparency, rendering and accurately printing the resulting colours.

To use this feature, users check the Optimise RGB transparency box in the colour tab of Job Properties.

Optimise RGB transparency box in the colour tab of Job Properties

Benefit:

Increases colour accuracy when printing PDF files

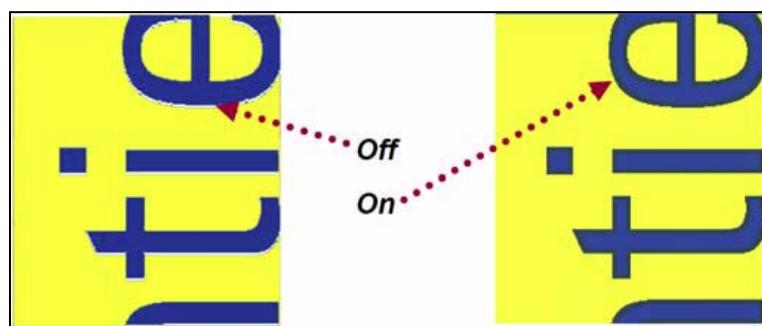

Auto Trapping (fixed)

Professional-quality colour documents are created by managing all aspects of colour on the page, including how colours interact with one another. Traditionally, this interaction of colour on a page was managed by

Fiery FS400 / FS400 Pro print servers – Product guide

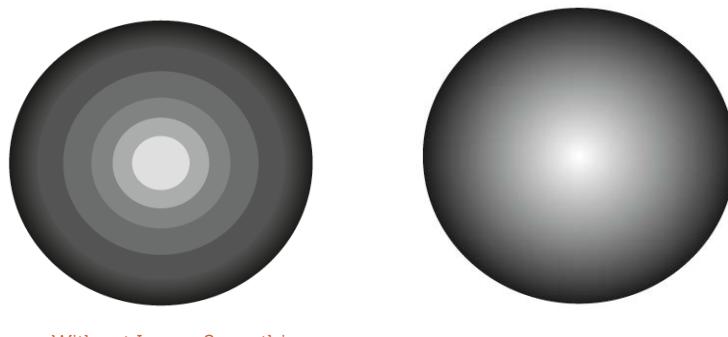

skilled operators using complex tools and techniques to accomplish the highest-quality results. By using the Fiery Auto Trapping feature, operators can achieve professional-level results without extensive knowledge of trapping rules. The feature accomplishes this by automatically adding a few pixels of the lighter colour into the darker colours so that the paper white does not show through registration errors.

The Fiery Auto Trapping feature applies trapping to jobs coming from any software application; it does not require the document designer to insert any information, and does not require special commands other than Auto Trapping: On/Off. The Fiery Graphic Arts Package, Premium Edition extends this feature to allow trapping between image and graphic data as well as trapping of pixels within a single image.

Enhanced gradient smoothing

The Image Smoothing setting in the Fiery driver and in Job Properties, uses proprietary Fiery processing for enhanced gradient smoothing. This ensures the highest quality print appearance for colour transitions found in design elements such as vignettes or vector gradients by removing objectionable stepping in the print output.

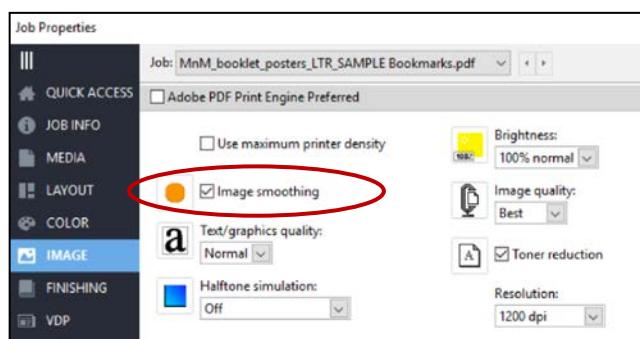

Without Image Smoothing

With Image Smoothing

Vignettes and vector gradients are common design elements that typically transition from a dark to a light colour.

The colour transition in these elements may look smooth on the screen, but it can present visible bands when printed.

Users can apply enhanced gradient smoothing by enabling the Image smoothing setting in the Image tab in the Fiery driver and in Job Properties.

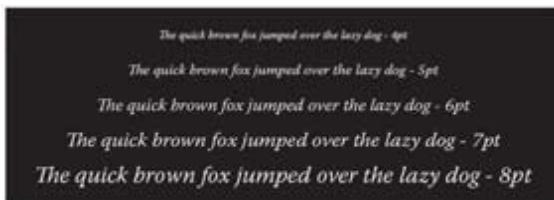

Fiery FS400 / FS400 Pro print servers – Product guide

Image smoothing setting in Job Properties and Fiery driver

Text and graphics quality (engine specific)

The Text/Graphics Quality feature applies processing enhancement to text and graphics, sharpening the edges of text and graphic images. Text/Graphics Quality is applied only when 100% colour is used in the image. Because pure cyan, yellow, or magenta elements are not a part of typical output — and because it's difficult to get 100% of toner in the output colours — the feature is mostly used in black elements for a sharper and smoother text and line art with minimised "jaggies" at a resolution of 2400 dpi.

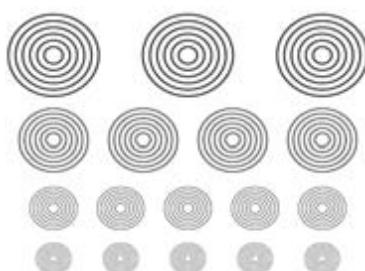

Refer to the Fiery user manual for print engines that support the Text/Graphics Quality capability for more information.

Text Quality

Line Art Quality

Benefit:

Increases output quality, achieving better definition of black text and optimised full-colour images

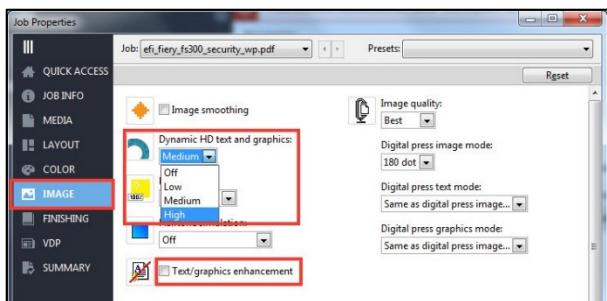

Dynamic HD Text and Graphics (engine specific)

Dynamic HD Text and Graphics is an exclusive Fiery feature that accurately reproduces ultra-thin lines, small text, and fine details in printed output. It also delivers lead/trail edge correction — a unique function that evens out the colour of the leading edge and the trailing edge of a character by compensating for the typically darker appearance of one edge and the lighter appearance of the other edge. It allows the Fiery server to process files at 1200 dpi, preserving high detail content and reducing jaggedness associated with half-toned, non-saturated objects.

Refer to the Fiery user manual for print engines that support the Dynamic HD Text and Graphics capability for more information.

Fiery FS400 / FS400 Pro print servers – Product guide

Dynamic HD Text and Graphics setting is in the Image tab in the Fiery driver and in Job Properties

Benefits:

Delivers maximum detail on even the finest unsaturated lines with true 1200 dpi print quality

Reduces jaggedness in both saturated and unsaturated text and line art

No impact on performance

Fiery Smart Estimator in Command WorkStation

Accessible from Command WorkStation, the Fiery Smart Estimator provides a cost estimate for toner or ink usage before printing a job.

The estimate is done by the Fiery server and is based on the raster data of the RIPped jobs.

This feature is most useful for specialty colours, such as clear, white, gold, silver, neon colours, etc. Since ink/toner for specialty colours is purchased separately and not part of the base CMYK click charge, users can customise Fiery Smart Estimator by selecting the local currency and entering the cost per bottle, cartridge, or liter. Once the calculation is performed, the estimated cost can be displayed on a job list column, job summary pane, and cost estimation details window.

The Fiery Smart Estimator is available on a product-specific basis. Refer to your Fiery server documentation for more information.

	Pages	Copies	Estimated Cost
Processor 1	14	1	€ 4.69
Processor 2	4	20	€ 28.49
Processor 3	8	1	€ 2.23
Processor 4	1	1	€ 0.01
Processor 5	1	1	€ 0.01
Processor 6	28	1	
Processor 7	1	1	

Fiery Smart Estimator accessible from Command WorkStation

Smart white

The smart white feature works on Fiery servers driving print engines that carry white toner or ink.

White ink is usually necessary when printing on coloured media. Applying white ink underneath translucent CMYK colourants blocks the coloured surface to lighten the resulting colour.

With the smart white feature, white toner/ink is used selectively, rather than as a flood fill. The feature calculates the lightness of the colour being printed and, if necessary, it adds white ink to achieve the targeted lightness. White is added in any amount from 0 to 100% as determined by reading the white point L* value in the output profile.

Fiery FS400 / FS400 Pro print servers – Product guide

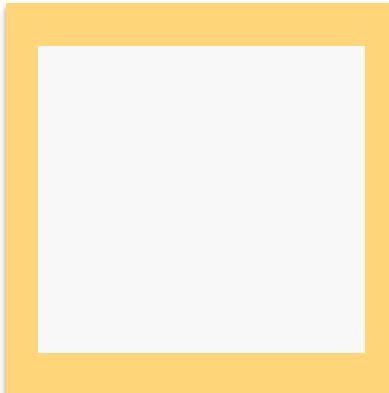

Image on colored stock, white fill, and smart white fill

Overall, smart white saves white ink/toner from being used where it is not needed.

The feature can be found in Command WorkStation Job Properties under the Specialty Color tab.

White ink/toner consumption can be previewed and verified by looking at the white ink/toner values in Fiery Smart Estimator (if supported) and Fiery ImageViewer.

The implementation of this feature may vary on different Fiery server models. For additional information, refer to your Fiery server documentation.

Certifications

Several industry organisations have tested and certified that Fiery servers can match industry colour references, and can be used for colour matching digital printing systems to offset presses.

Idealliance and G7

Digital Press Certification from Idealliance is a popular U.S. certification program, available for digital print systems that consist of a printing press and a DFE. These print systems must meet or exceed established industry tolerances for excellence in the areas of colourimetric accuracy, uniformity, repeatability, durability, and registration.

Print systems that achieve Idealliance Digital Press Certification are verified to be capable of simulating GRACoL standards within tight colourimetric tolerances. This means, by definition, that they also match G7 standards to the highest level of compliance — known as “G7 Colorspace.” G7 qualification is also offered by Idealliance for individual print shops, but there is no G7 certification for digital print systems, since systems that achieve Digital Press Certification are already matching G7 Colorspace requirements.

For digital press systems to match industry references such as GRACoL, user must create a custom output profile with a tool like Fiery Color Profiler Suite.

For more information refer to:

fiery.efi.com/idealliance-certified-systems

fiery.efi.com/color-standards-whitepaper

FograCert

FograCert is a popular standard in Europe. Fogra-certified Fiery servers meet the criteria and tolerances stipulated in the current draft (ISO/FDIS 12647-8) for the certification of contract proofing systems and for contract proof creation as tested by the Fogra Graphic Technology Research Association. FograCert is similar to Idealliance digital press certification, except that it requires a colourimetric match to the FOGRA39 colourspace. FograCert-approved digital print systems also require that the DFE can print PDF/X-4 test suites correctly.

For more information refer to:

fiery.efi.com/fogra

fiery.efi.com/fogra-vps-certified-systems

fiery.efi.com/color-standards-whitepaper

Connection

Fiery technology delivers valuable integration to any type of print environment, offering a high return on investment because the open Fiery platform technology integrates with most JDF-enabled solutions and with most popular network environments. In addition, Fiery servers deliver the most comprehensive set of tools for IT managers to help keep the software updated, to automate security controls, and to simplify the administration of the Fiery server on the network. The following table represents the standard configuration for each Fiery server platform and system version combination. *For information on a specific Fiery server's feature set, refer to the datasheet for that model, or ask your Fiery vendor about support for a specific feature.*

Fiery JDF

What is job-description format (JDF) technology?

JDF is an open-standard technology that allows data to pass between different applications and systems for automated print production workflows, specifying how jobs are managed and produced. JDF allows MIS, web-to-print, and prepress solutions to communicate with each other. The electronic JDF job ticket simplifies data exchange and collection, eliminates manual data entry and re-entry, makes print production faster, and increases efficiency and accuracy.

Fiery JDF, available on Fiery servers, provides support for JDF workflows from the Fiery system itself. It provides the functionality of the Fiery server and user-interface elements in Fiery Command WorkStation needed to integrate the Fiery server in JDF workflows. This enables bi-directional JDF device connectivity between JDF submission tools (submitting JDF intent or JDF process job tickets through Job Messaging Format) and the Fiery server.

The Fiery Integration Package provides the easiest way to install and configure the latest Fiery JDF v1.5. This version of Fiery JDF provides numerous enhancements for integrated workflows with EFI Productivity Software, third-party prepress workflows, as well as in-house custom integrations. The enhancements also include memory usage optimisation and stability improvements, plus new JDF-enabled Fiery features:

Define chapter — This feature provides an easy way to automate chapter creation for long documents, and to submit batch tasks with multiple documents included in one job with separators or chapters. It allows integrated upstream software to specify chapter starts by entering the document's page number using JDF. The function is equivalent to the Fiery Chapters feature from Job Properties.

Rotate content layout — Provides the JDF interface to specify automatic 180-degree rotation for layout adjustments. This is equivalent to the Fiery server's Rotate 180 feature from Job Properties.

Fiery FS400 Pro, along with Fiery FS350 Pro, FS300 Pro, Fiery 200 Pro, Fiery FS150 Pro, Fiery FS100 Pro, Fiery System 9 Release 2 and 10; are the first systems to achieve the JDF1.3 Integrated Digital Printing Interoperability Conformance Specifications (IDP-ICS) certification by CIP4.

For more information, please visit the CIP4 website: fiery.efi.com/cip4-certified-experts

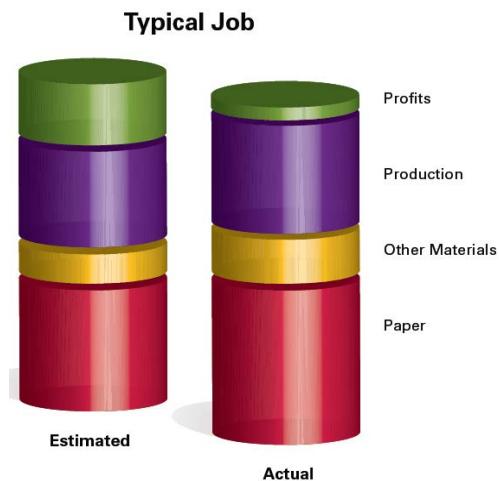

In addition, Fiery JDF is now available for Fiery embedded systems through the [Fiery Automation Package](#) for selected Fiery products. This lets more users integrate print workflows and business management systems. Visit the [Fiery JDF supported printers webpage](#) to see the list of Fiery embedded servers that offer Fiery JDF support through the Productivity Package.

For more information, refer to fiery.efi.com/fiery-jdf.

Increases productivity by eliminating manual data entry and re-entry

Fiery JDF technology allows job tickets and metadata to move through systems without human intervention, and automatically collects production data. It eliminates much of the need for users to enter job and production data, dramatically decreasing waste and error. The technology enables unattended job processing and frees up users to complete other tasks that involve higher-level skills, which ultimately increases profits. In addition, customer satisfaction is dramatically improved because jobs are delivered right, on time, and on budget.

Fiery FS400 / FS400 Pro print servers – Product guide

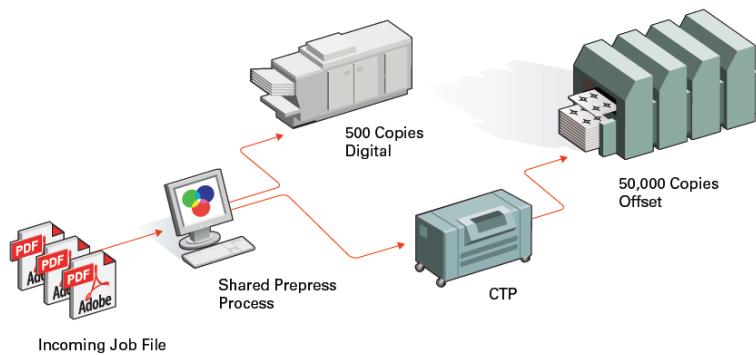

Job production component breakdown

Provides highly accurate business intelligence

Fiery JDF technology captures print production data, such as media usage and job running time, and disseminates it to the appropriate business software (for example, print MIS) for more accurate reporting, estimating, and accounting. Now business owners and managers get automated business intelligence that can help them assess their profitability.

Supports hybrid workflow for the best of both worlds

If a print provider using prepress systems such as Agfa Apogee, Heidelberg Prinect and Kodak Prinergy has both offset and digital printing solutions and needs to move jobs back and forth, Fiery JDF technology can serve as an easy and quick mechanism to direct jobs to the appropriate systems, enabling hybrid workflow. JDF jobs can be managed with a common user interface for multiple devices, and can be automatically routed to the most cost-effective devices.

Hybrid workflow example

Fiery JDF technology also allows analog print shops to easily expand their businesses with digital print capabilities for on-demand, cost-effective, and value-added services such as variable data printing. Now those businesses can meet customers' demands for faster turnaround times and short-run jobs with capabilities that only digital printing and hybrid workflow environments are able to produce.

Maximises ROI through integration and scalability

Fiery JDF technology not only makes print production business more efficient, but also opens new doors for future expansion. It works with many third-party solutions and in-house systems by using JDF industry standards with nonproprietary formats to provide flexible, out-of-the-box interoperability.

It integrates seamlessly with EFI web-to-print, Print MIS, and production workflow solutions; and is supported by more than 30 partner technologies, including Agfa :Apogee, Heidelberg Prinect, and Kodak Prinergy. The

Fiery FS400 / FS400 Pro print servers – Product guide

integration enables print providers to meet their business needs now and in the future, and allows businesses to scale using the same solutions.

Fiery JDF technology is a standard feature for Fiery servers. Visit fiery.efi.com/fiery-idf today to view the current list of JDF-enabled Fiery digital print servers. To talk to peers and EFI experts about the technology, participate in our JDF communities at communities.efi.com.

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery API

Print workflows are unique to every print business. Fiery application programming interface (API) allows print shops to rapidly develop unique apps and tools for specific business needs on a variety of desktop or mobile platforms including Windows, Mac OS, iOS, and Android – using the development environment of their choice. The RESTful Fiery API exposes the Fiery interface, and establishes a secure bi-directional connection with Fiery servers. This allows developers to extract job data for custom uses such as cost analysis and optimised scheduling, and to submit jobs with basic settings from existing applications. Fiery API can:

- Request job-log data on Fiery servers for custom accounting and supply-tracking needs
- Control certain job actions such as process, print, and delete a specific job or all jobs on the Fiery servers
- Submit jobs to Fiery servers from an app with a simple command
- Retrieve current status for actions such as printing and errors, and gather real-time printer reports with simple commands
- Access previews of a processed job generated by the Fiery servers for softproofing

Users can find the resources they need to get started at developer.efi.com. These include sample codes, API documentation, and how to get an evaluation license for their project.

The free Fiery API Evaluation Key gives access to the full set of standard Fiery API functions for 90 days. This helps developers evaluate the potential use of the API for unique business needs.

Fiery Go, the free app for smart phones and tablets, takes advantage of Fiery API and lets users access Fiery servers remotely from their iOS or Android devices. Fiery FS400 and Fiery FS400 Pro servers come with Fiery API, so they're ready to communicate with mobile devices out of the box.

Developers can download latest Fiery API using the Fiery Integration Package or Fiery Updates. Version 4.0 adds new APIs and usability improvements to easily integrate in-house tools and applications with Fiery servers for unique business needs such as:

Job submission with Paper Catalog ID – Submitting jobs from custom applications is now much simpler, allowing developers to specify media with a unique Paper Catalog ID.

Partial search for jobs – This allows in-house applications to filter and search jobs on the Fiery server by the exact value or partial value, and based on desired job attributes such as job titles and job status. For example, applications can search "efijob" to see "efijob01" and "efijob02," instead of calling the exact two names.

WebSockets API support – WebSockets API enables live-event-based connectivity with custom applications. Developers can open an interactive live communication session between a custom application and the Fiery server. With this API, they can send messages to a server and receive event-driven responses (such as job status: spooling, printing, printed, error; or press status: printing, paper jam, toner low, etc.) without having to constantly poll the server for a reply. So the events are 100% live without delay and give a fast response with efficient data traffic (uses less computational power and data than polling).

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery API feature highlights

Server login, administration, and status

Feature	API calls	Description
Login	POST login	A POST request that establishes secure, authorised user access to the Fiery API features from your application with a Fiery API access key.
Logout	POST logout	A POST request to terminate an authorised session initialised by the POST login request.
Info	GET info	A GET request to list a Fiery server's basic information such as hardware info, serial number, language settings, and time zone.
Consumables	GET consumables	A GET request to report information about the tray, and supply of paper and toner on the print engine.
Server	POST server	A POST request for actions on the Fiery server such as start or stop server, restart or reboot server, and cancel RIPping or printing.
Devices	GET devices	A GET request to retrieve information about the connected printer and current job progress of printing or RIPping.
Print system pages	POST printpages	A POST request to print system pages such as system configuration page, PostScript or PCL test page, and font list.

Job and queue management

Feature	API calls	Description
Jobs	GET jobs	<p>A GET request to list the all jobs presently in the job list on the Fiery server, including printed jobs.</p> <p>Specify job attributes to be shown for each job Filter jobs by username or job status such held jobs, RIPped jobs, or printed jobs</p>
	GET jobs/ID	A GET request to retrieve job info with a specific job ID.
Job preview	GET preview	<p>A GET request to retrieve preview images of the job</p> <p>Specify job with job ID Specify page number of the job Specify the size of the preview image: thumbnail, screen size, or full size</p>
Job submission	POST jobs	A POST request to submit job with a file, a Fiery Preset or Virtual Printer setting and basic job attributes.
Job actions	PUT jobs/ID/method	<p>A PUT request to perform job actions for existing jobs in a queue with a specific job ID. Available actions include:</p> <p>Print, print and hold, rush print RIP (process job), re-RIP Cancel, remove raster data</p>
Job reorder	PUT jobs/ID/move	A PUT request to reorder a specific job to be a first or last in a queue, or put in before or after a referenced job.
List queues	GET queues	A GET request to list the printer queues (logical printers), including Fiery Virtual Printers, configured on the Fiery server.
Create queues	POST queues	A POST request to create a new printer queue (logical printers) with a name, print action, and basic job attributes.

Fiery FS400 / FS400 Pro print servers – Product guide

Cost accounting and job log

Feature	API calls	Description
Cost	GET cost	A GET request to retrieve Fiery job logs containing selected accounting information for each printed job.
	GET cost/ID	A GET request to list selected accounting information with a specific job ID.

Fiery IPDS (please check feature matrix for availability)

Fiery IPDS provides a high-performance, [IS/3 compliant](#) IPDS solution that leverages industry-leading Fiery technology for rendering, variable data, colour management, and imaging. This solution enables print service providers to manage all data streams (IPDS, PDF, PostScript, and VDP formats such as PDF/VT, PPML and VIPP [Xerox servers only]) from one single interface.

IPDS jobs are sent from the host to a streaming queue on the Fiery server. Jobs are immediately processed with no spooling to disk, but fully supporting IPDS job buffering. The job then processes and prints. Once the job is completed and all notifications have been provided to the host, pertinent data is noted in the Job Log, but no other information about the job remains on the Fiery server. The Fiery server provides bi-directional communication and ACK-NACK notifications to the host.

Fiery IPDS is available as an option on a product-specific basis. To determine if Fiery IPDS is available for a specific Fiery server, please refer to the product-specific documentation.

Integration with EFI MIS and Web-to-Print solutions

Fiery servers integrate with EFI Management Information Systems (MIS) and web-to-print workflows in order to:

Deliver job specifications entered at a MarketDirect StoreFront or PrintSmith site client, or at the EFI MIS. The information is validated and transferred to the Fiery server without touchpoints, delays, or errors common in a disconnected workflow. The Fiery server uses this information to configure the job, automatically preparing it for output on the digital engine.

Track job costing information to perform accurate and timely cost analysis and invoicing.

Analyze information about equipment and employees to provide management staff with the details they need to make more informed business decisions.

Below is a summary of key customer benefits for each EFI solution that integrates with Fiery servers. For more information visit fiery.efi.com/fiery-integration.

Tools for technical support

Fiery Setup Wizard

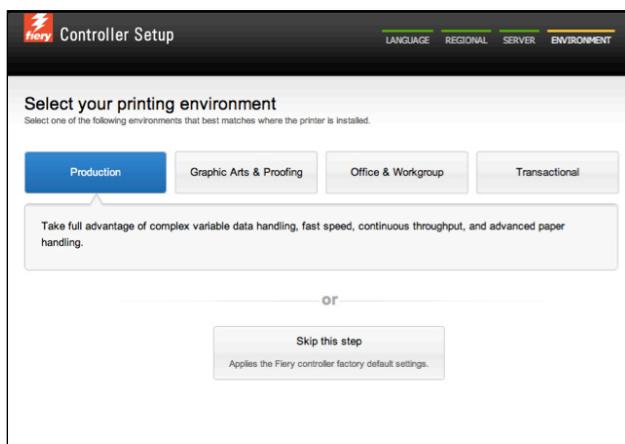

Fiery Setup Wizard optimises settings for a particular print environment during the install process. It allows the administrator to quickly and easily specify basic Fiery server settings such as language, region, server, and environment (a group of standard settings). The available environments are:

- Production
- Graphic arts and proofing
- Office and workgroup
- Transactional

By presenting a simple wizard with four screens, Fiery Setup Wizard makes the setup process easier and more accurate. Fiery Setup Wizard works on Fiery servers running FS100/FS100 Pro or later and based on Linux or Windows operating systems.

The Fiery Setup Wizard is available from the following locations:

- Command WorkStation
- WebTools
- Fiery QuickTouch for NX external servers

Settings are customised for each print environment.

If users do not initially configure the Fiery Setup Wizard from Fiery QuickTouch, it is still available from WebTools > Home, or from Command Workstation > Configure.

Benefits:

- Correctly sets up the Fiery server for the user's environment and language
- Provides the best out-of-box experience for users and administrators
- Speeds installation for technicians

Recommended settings per environment

Fiery FS400 / FS400 Pro print servers – Product guide

Fiery System Restore

Fiery System Restore is available on Windows-based external Fiery servers running FS100 Pro, FS150 Pro, FS200 Pro, FS350 Pro, FS400 Pro. It supports the new Unified Extensible Firmware Interface (UEFI) hardware platforms and offers the ability to:

- Back up and restore to network drives
- Back up Fiery jobs
- Restore to a factory-default system image
- Create a bootable USB recovery device

See the EFI Fiery user documentation for your Fiery server for instructions on how to use Fiery System Restore.

RECOMMENDATION: EFI strongly recommends a full backup of the system image on a regular basis. This backup should be stored offsite.

Fiery System Restore enables users to back up/restore to network drives.

Benefits:

- Gives administrators the flexibility to quickly back up and restore a Fiery system image
- Eliminates the need for a separate backup application
- Allows analysts and customers to easily and conveniently restore a customer system

Fiery Hardware Diagnostic Tools

These tools offer diagnostic tests that may identify problems with Fiery server hardware. The tools are designed for specific Windows-based Fiery hardware platforms, and are for analysts and technical support representatives of Fiery partners. Check the documentation of your Fiery server to identify the hardware platform name and version number.

- Fiery NX Premium
- Fiery NX Pro
- Fiery NX One
- Fiery QX¹⁰⁰
- Fiery PRO⁸⁰ or PRO⁹⁰
- Fiery SP³⁰

If you don't have these Fiery diagnostic tools, please ask your technical support team for a downloadable version. Instructions are included with the download.

Fiery Clone Tool

Fiery Clone Tool for embedded servers

The Fiery Clone Tool for embedded servers creates an identical copy of the entire Fiery server to an image file, with the exception of previously created clone image files and any print jobs in the Print queues. This image file can then be used for a fast and easy system recovery. This feature is intended for use by technical service representatives only. The Fiery Clone Tool for embedded servers can be used on any identical Fiery server model. There are no restrictions on the Fiery software products included on the clone.

The Fiery Clone Tool for embedded servers supports System 8eR2 and later on Linux operating systems only. The tool will display an error if used on an unsupported Fiery server. For more information, refer to the user guide available in the [EFI Download Center](#).

Users boot and launch this tool from a USB drive prepared by the USB Prep Tool version 1.3.4 or later. The minimum size for the USB drive is 4 GB.

The Fiery Clone Tool for embedded servers software can also be downloaded from the [Download Drivers](#) page of efi.com. Click the Application Software and Tools tab to select Fiery Clone Tool for embedded servers.

Benefits:

Performs an effective cloning process with simple and intuitive steps

Delivers easy and fast recovery of the Fiery embedded server and restores the system to production mode in minutes.

Fiery Configure

The Fiery Configure feature allows a Fiery administrator to configure the Fiery server for a specific print environment. When the administrator selects the Configure button, Fiery Configure displays a browser-based user interface with:

The current Fiery configuration and access to the Edit button to enter modifications

A check for the Product Updates button to open a list of available software updates for that Fiery server

Fiery Configure provides:

Support for all current web browsers, without the need for special plug-ins

Three menu levels to allow users to easily move between settings

Inline guidance to minimise mistakes

Search function to find relevant settings more quickly

Support for constraints to guide users when selecting conflicting settings

Usability improvements that allow settings used in multiple places, such as email or proxy, to be linked for easy access

If new settings need a restart or reboot, the tool notifies the user at the top of the screen and immediately saves settings that can be applied instantly

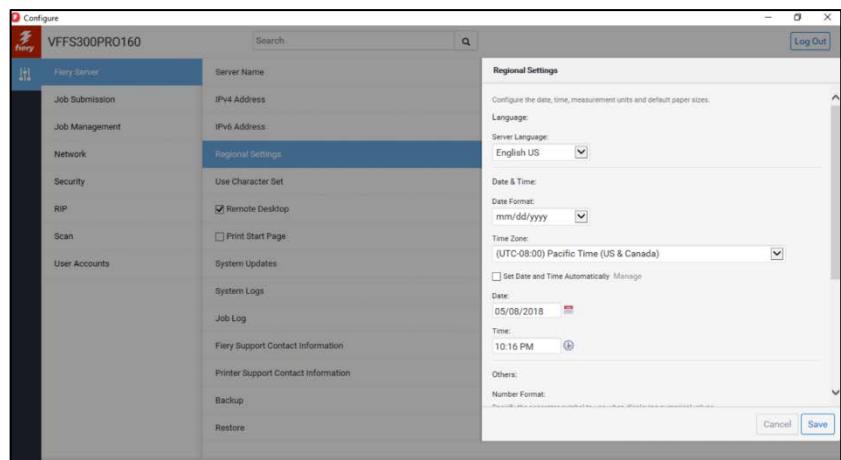

Data transfer over HTTPS for additional security

Updated config sheet to reflect the categories displayed in the current Fiery configuration view

Benefits:

Helps administrators get the Fiery server ready for production in a shorter time

Minimises service calls

Fiery Configure tool

Improved serviceability

Fiery servers offer a comprehensive set of tools to ensure your server is up and running 24/7 and ready to face the challenges of a high-production environment. To achieve that, the servers come with:

- Fiery Updates from Command WorkStation
- Automatic system backups
- Fiery Installer Builder
- Improved server configuration sheet
- Job Error report
- Clear Server enhancements

Taken together, these features facilitate easy installation and setup; provide quick software updates that don't affect production time, but make sure you always have the latest software installed; and configure your server for the needs of your specific print environment. They also help resolve technical issues faster by facilitating communication with technical-support teams, and help you recover quickly from an unexpected system failure.

Fiery Updates from Command WorkStation

Serviceability improvements in Fiery FS400 Pro offer administrators, analysts, and technicians better ways to ensure that Fiery servers are always up to date, minimise downtime, and provide fast recovery of Fiery servers.

Fiery Updates is a new feature introduced with Command WorkStation 6. Because timely software updates are critical for optimal operation of Fiery servers, Command WorkStation offers administrators an easy way to get notifications, downloads, and installation of approved and released Fiery system updates.

Administrators can get to Fiery Updates through the Device Center and can then perform updates, even from remote client computers. From those client computers, they can also update Fiery servers that may not be connected to the internet. On the Fiery Updates screen, administrators can also see all the patches and service packs available and waiting to be installed for external or embedded servers.

Fiery Updates ensures the right sequence of patch updates to guarantee effective installation and avoid incompatibilities.

Benefits:

- Minimises production interruptions
- Easily keeps Fiery servers up to date

Automatic system backups

Fiery administrators now have an easy way to schedule automatic Fiery system backups to guarantee fast recovery — without the need to restore from a DVD media kit.

They can manage backups using Fiery WebTools or the Fiery QuickTouch interface. With these tools, it can take less than an hour to restore from a backup — 1/8th the time it takes to restore from a DVD kit.

Fiery servers allow users to capture many settings for the backup and restore procedure:

- Fiery system settings
- Colour settings
- Preflight presets
- Scan settings
- Command WorkStation settings when backing up from Command WorkStation
- FreeForm/VDP resources
- Paper Catalog
- Virtual Printers
- Server Presets

Fiery FS400 / FS400 Pro print servers – Product guide

Fonts

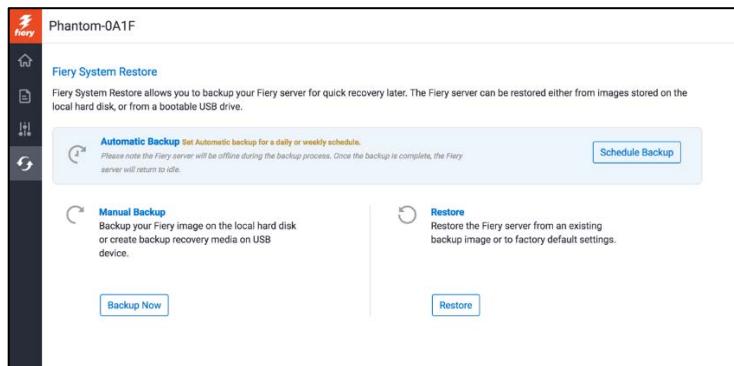

Job Log

Benefits:

Sets up an automatic backup schedule from Fiery QuickTouch and WebTools

Restores the Fiery server in less than an hour

Doesn't require a DVD kit

Fiery Installer Builder

The Fiery Installer Builder manages the download of a complete Fiery software and operating system image to reinstall the Fiery server using the USB port. This tool is currently for servers without a DVD drive..

The Fiery Installer Builder downloads from a cloud location, and allows users to prepare a bootable USB flash drive to install the software on a Fiery server. Users can also install the image from their computer to a replacement Fiery hard disk drive using a USB-to-SATA adapter cable for external servers.

The image will include all the software that was previously on DVD kits:

Operating system

Fiery software

User software

Any other Fiery software that is pre-installed for that particular Fiery configuration

The Fiery Installer Builder is designed as a tool for analysts and technical support representatives of Fiery partners, who will find it [on the EFI Sales Portal](#). Login requires valid EFI Sales Portal credentials.

For full instructions, see the [Fiery Installer Builder User Guide](#) and check the [Frequently Asked Questions](#) for more information.

Improved server configuration sheet

Fiery servers include a new version of the Fiery configuration sheet to improve readability.

At the top of the new configuration sheet, users now see commonly used items such as server name, IP address, and printer name. If printing the configuration sheet from a Windows-based Fiery server, users will also see details of the Fiery applications and the version numbers installed on the server — for example, Fiery Command WorkStation 5.3.0.54 or Fiery Hot Folders 3.3.0.29. Having easy access to this information makes it easier for technical support staff to reproduce user scenarios.

Fiery FS400 / FS400 Pro print servers – Product guide

Users can print the server configuration sheet, or save it in a PDF or text format. When printing the server configuration sheet from the Command WorkStation Device Center, users can also choose Job Properties so they can print on whatever media is loaded in the trays.

Benefits:

Improves usability by making it easy to access all necessary system information from one location or in one printed document

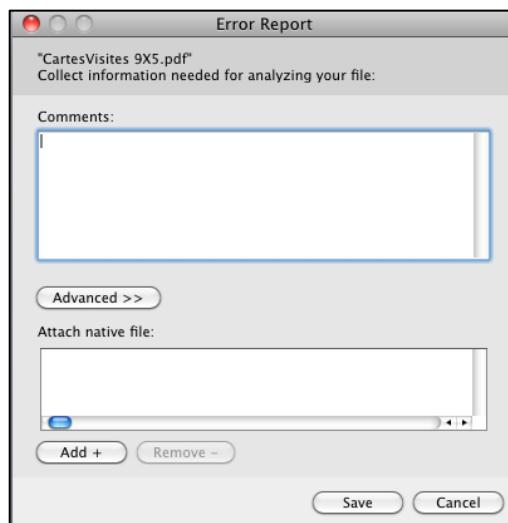

Allows administrators to print the configuration sheet on any paper size or weight

Improved server configuration sheet

Job error report

The Job error report captures important troubleshooting information that EFI Technical Support personnel use to resolve issues. This feature automates collection of the raster file, native file, colour profiles, job logs, configuration sheet, job and job ticket, engineering logs, and optional operator comments into a zip file that users can save on the desktop with a simple click. By using this collected information, EFI Technical Support can provide faster problem resolution.

Creating an error report

GDPR compliance

This section describes the compliance of Fiery products with the General Data Protection Regulation (GDPR).

EFI does not automatically collect any personal data from Fiery DFEs without the consent of the owner/operator of the printing system.

EFI, or EFI's partner manufacturer of the print engine, may request a Fiery DFE server configuration sheet. This sheet contains one or more IP addresses that may identify the business, but likely not an individual. It may also be necessary to send EFI an encrypted Fiery Job Error Report and possibly other reports to further identify and solve technical issues. Server IP address, job name, and a user or job submitter name, which may or may not constitute personal data, are collected along with Fiery operational data. EFI partners will sometimes provide EFI with the name of an individual and his or her contact information to allow EFI to contact the owner/operator to gather more information or to provide direct technical support to resolve a problem.

Benefits:

Facilitates communication of all necessary information to EFI Technical Support

Provides faster and easier resolution of problems

Fiery FS400 / FS400 Pro print servers – Product guide

Clear Server

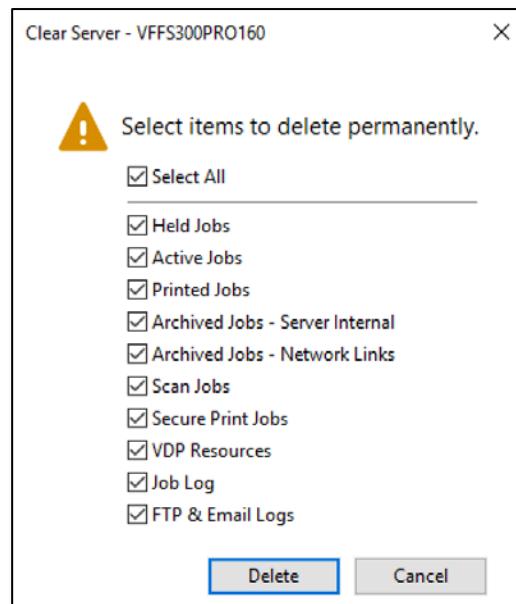

The Clear Server feature provides expanded cleanup choices to securely erase unwanted jobs or user data. It offers a dialog box that allows the user to clear selected file types, resources, or logs from the currently selected server. Administrators can use it to securely erase secure print jobs, VDP resources, FTP and email logs, and other types of information. This also helps to improve the security of the Fiery server. The latest enhancement ensures that the Clear Server option is available for all user job data and, if the Secure Erase preference setting is enabled, the selected items are securely erased from the server. It is a standard feature for external and embedded Fiery servers.

The Clear Server setup window is located in Command WorkStation under the Server menu.

Benefits:

Lets administrators control what to keep on or remove from the Fiery server

Securely erases selected data from the server

The expanded list provides the administrator with greater control.

Network integration and security in corporate environments

EFI networking technologies allow users to print and manage Fiery servers from popular network environments. Fiery servers deliver the most comprehensive set of tools for IT managers and system administrators to help keep the software updated, to automate security controls, and to simplify the administration of the Fiery servers on the network.

From controlling access to the Fiery system to managing open network ports and securing the system's hard drive data, the Fiery server is flexible in its configuration and rigorous in its implementation of security protocols.

EFI is committed to continuously supporting customers with security solutions. For more information, refer to the [Fiery Security White Paper](#).

Fiery FS400 / FS400 Pro print servers – Product guide

EFI IQ

The IQ suite of applications lets users connect people, processes, and print devices, so users can make better data-driven decisions. Use these free and paid applications to:

Visualise key production data and the current status of printers in near real time from IQ Dashboard

Capture and transform print production data into actionable analytics to drive business improvement with EFI Insight

Stay connected with print devices from iOS or Android mobile devices with EFI Go

Streamline the colour verification process and gain insights into your colour quality across Fiery Driven™ print systems to produce accurate, consistent colour with EFI ColorGuard

Gain control of print output environment by maintaining Fiery® servers in optimal condition, and keeping Fiery DFE's in compliance with EFI Manage

Receive alerts about production-blocking events, and automate distribution of production reports to ensure that you never miss any production issue with Notify

Build a stronger, more profitable business with production data using EFI IQ applications.

For more information, visit <https://www.efi.com/products/efi-iq/>.

[Watch a video](#)

EFI IQ Dashboard

Users can get a quick overview of the current state of their printers. Use key production metrics like these, so users can make data-driven decisions to get more volume out the door:

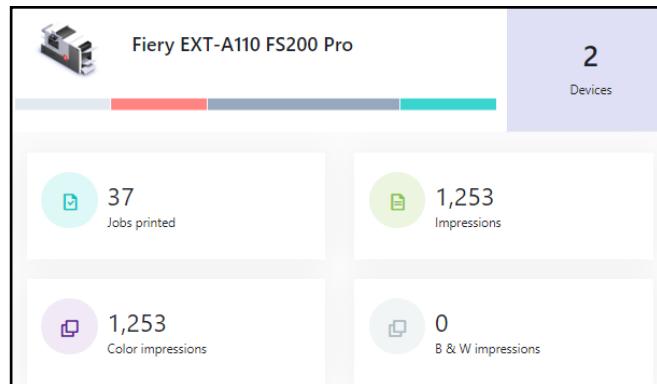

Total number of jobs printed, including colour and black and white impressions

Status of each printer

Device view specific to user role in the company

Consumable details for each printer

Device configuration

Users can also launch free and paid EFI IQ applications.

EFI Insight

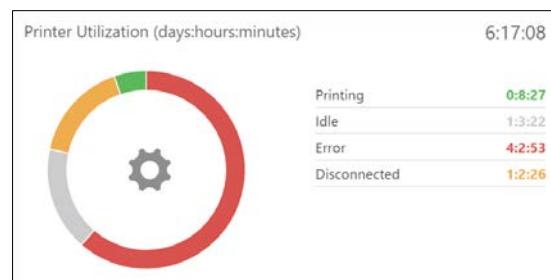

EFI Insight captures key print production data, and transforms it into useful visual analytics to provide valuable, actionable information. With Insight, users can:

Monitor printer utilization analytics and take steps to maximise uptime

Use job by source information to identify opportunities to increase the use of automated workflows

Track printer usage for upcoming equipment purchases and renewal planning

Compare print device performance, identify production bottlenecks, and uncover areas where your staff may need additional training

Fiery FS400 / FS400 Pro print servers – Product guide

Identify patterns of consumable usage to forecast volume demands based on historic trends

Build a stronger, more profitable business with production data using EFI Insight analytics.

Benefits

Trend

- Monitor production trends to identify inefficiencies in workflows or pinpoint issues that are affecting productivity and profitability.
- Analyze the cause of idle time and take steps to improve device utilization
- Make better, faster decisions by knowing what is happening in real time
- Improve workload balance and capacity planning

Compare

- Compare data from printers at the same or different locations.
- Share best practices within an organization to increase performance
- Drill down into production-blocking events and share information with operators so they can act to improve response times

Job Log

- Export production metrics for further analysis
- Download the data to eliminate manual data entry

EFI Go

Use EFI Go to stay connected with a print production system and get the information needed to make decisions to achieve higher productivity.

View current printer status, and toner levels

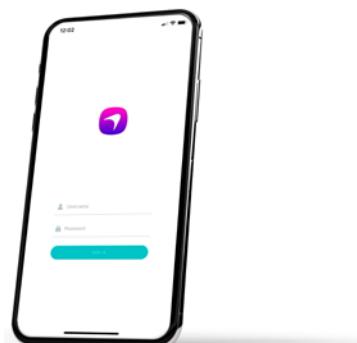

Check printer status, warnings and error messages

Get a complete printer state statistic for the last 24 hours or more (up to a week)

Monitor the print queue to see the list of jobs lined up for printing, and the list of printed jobs

Receive notifications about print system errors so you can accelerate print system restoration

Get more work done by maintaining 24/7 access to print devices.

EFI ColorGuard

Today's digital presses deliver stunning print quality. But, without a good colour verification process, the printed results may not match the expectations of colour-critical print buyers. In that case, they may reject jobs due to poor colour quality – leading to higher costs and lower profitability. To avoid this, users need a solution that can streamline their colour verification tasks and track colour quality to achieve consistent, accurate colour quality.

Benefits

Schedule

- The scheduling capability brings order to production quality chaos by standardizing the colour verification process
- Eliminates ambiguity and guesswork about colour verification tasks by making the process of measuring colour quality a standard operating procedure across print manufacturing operations

Fiery FS400 / FS400 Pro print servers – Product guide

- Increases operating efficiency and customer satisfaction with higher colour print quality

Notification

- Automated notifications about colour verification status keeps the production manager and press operators focused on colour quality.
- Reduces press downtime and lowers the total cost of ownership by regularizing colour verification and device calibration
- Reduce job reprints to increase customer satisfaction and eliminate waste

Colour Compliance

- Seamless integration between Fiery® servers and EFI ColorGuard makes it easy for print production managers to follow colour verification process and generate colour compliance report.
- Improves visibility of colour quality by connecting production teams and colour verification processes in real time through EFI cloud technology
- Enhances responsiveness of print production teams to achieve the best colour quality by providing real-time access to colour verification data

Analytics

- Powerful analytics and trend tracking helps print managers increase operating efficiency and improve colour-quality performance over time.
- Get real-time visibility into the colour verification results and trends anytime, anywhere
- Use colour compliance reports to position yourself as quality-driven print service provider

EFI Manage

If users want print production to run smoothly, it's crucial to stay in control of a print environment every day. EFI Manage lets you:

Create, store, and deploy configurations across all Fiery Driven™ devices of the same model, for more consistent quality and predictable production

Check and report Fiery systems that don't match master configuration, so users can take immediate action to bring Fiery DFE back in compliance

Identify print device issues that are blocking print production, so users can minimise production slowdowns

Benefits

Sync

- Achieve optimal print outcome by creating, storing, and deploying configuration packages that include colour profiles, presets, and paper catalogs on devices of the same model for consistent print quality.

Compliance

- Maintain consistent production performance by checking and reporting Fiery system that are not in compliance and taking immediate action to keep them up to date.

Monitor devices

- Keep print production running smoothly by remotely monitoring your print devices, identifying issues that are blocking print production, and directing the operator to respond quickly.

Fiery FS400 / FS400 Pro print servers – Product guide

Cost accounting and billing integration

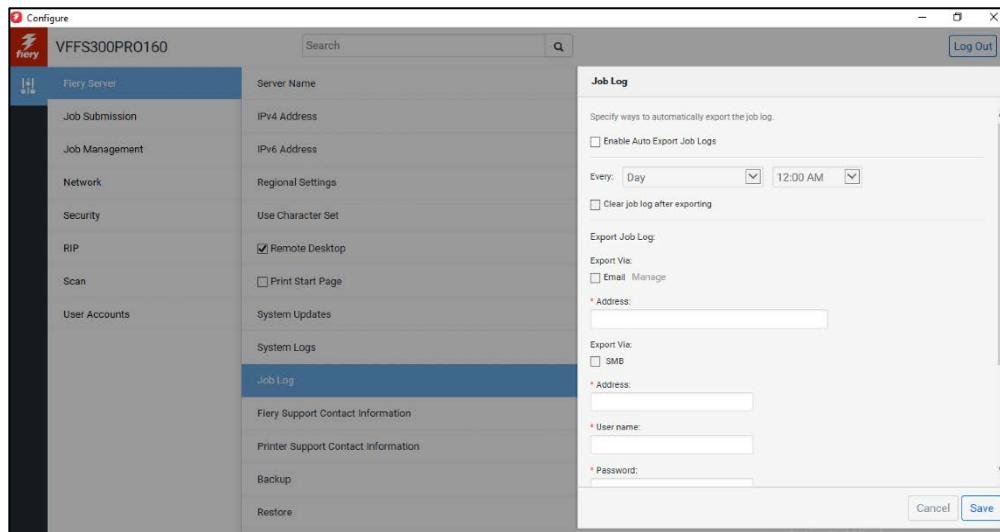

Fiery Job Log

A robust job log tool is available through the Device Center of the Fiery Command WorkStation to users with operator-level or higher privileges. The Fiery Job Log provides a record of all job activities. The Job Log can be viewed at the Command WorkStation, Device Center, logs tab. Users can customise the Job Log by selecting the columns of information to be displayed. They can sort the data by several criteria. A job log can be used for accounting, billing, and tracking equipment usage. Customizing job logs makes it easier and faster to search for specific data in the Job Log.

Date/Time	Job Title	Print Status	User	Number Of Pages	Total Number Of Pages	Job ID

Print job logs

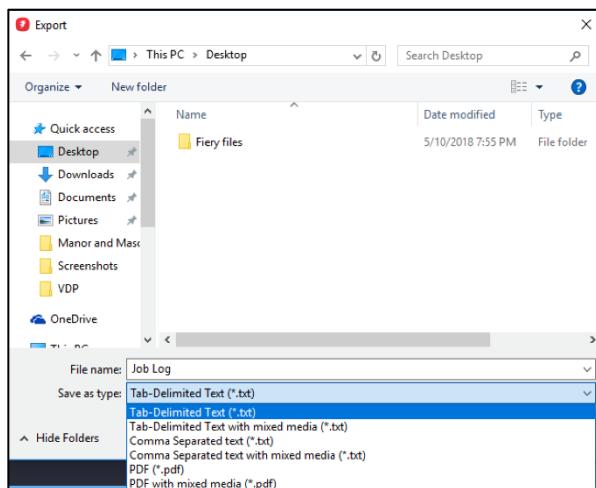

Users can print the Job Log at any time. To assign Job Log printing privileges and select the paper size to print it on, go to Configure / Server / Job Log.

Fiery FS400 / FS400 Pro print servers – Product guide

Export Job Log

Users can export the data in the Job Log as a txt or pdf file. They can export the complete log (all the data that is collected) or the current view (only the data they selected to display in the Command WorkStation, Device Center, logs tab).

Job Log Auto Export

The Fiery administrator has the option to automatically send, clear, and save the job logs at a scheduled time. They can choose to submit the job log by email, or save it to an SMB or FTP location.

This feature is configured through Command WorkStation or the Configure tool. It allows the Fiery administrator to define their Job Log preferences, including options such as where to send the job log, the schedule for sending (such as weekly, monthly, etc.), and whether to clear the job log on the Fiery server after sending. This is a "set-and-forget" feature, which requires no user intervention after initial setup.

The job log is sent as a comma-separated-values (CSV) formatted text file that contains the default set of Job Log columns, as they appear in Command WorkStation.

This feature is ideal for corporate and education environments where the accounting department requires a job log report for costing purposes, but the accounting staff does not have Command WorkStation or know how to retrieve these logs.

In addition to the convenience of automatic job log transmittal, automatic clearing prevents the log from becoming too large and taking up unnecessary resources on the Fiery server.

Benefits:

Saves time by automating report generation and submission

Improves accuracy of cost management and control by improving communication of Job Log reports to accounting departments

Automatic retrieval of job log guarantees access to exported data, even if Fiery software is reinstalled

Tracking jobs with PaperCut

Managing production print with PaperCut MF or NG allows Fiery customers to allocate costs with Fiery tracking and reporting. Administrators can now limit unnecessary printing and encourage positive user behavior to enable Fiery cost recovery.

Fiery Driven devices have the ability to hold and reprint jobs, and to manage the print job settings after PaperCut has analyzed the job on the print server. For this reason, users need a custom program to integrate PaperCut to track print jobs released from Fiery servers. PaperCut has developed a program that checks Fiery print logs and updates PaperCut with the jobs that are reprinted. For more information visit [EFI's PaperCut page](#).

Tracking jobs with Equitrac

Equitrac® gives businesses the flexibility to let users print what they need and when they need it, while reducing the costs and complexities of deploying a print infrastructure. It is the most intelligent way to print—reducing costs, making printing secure and increasing user satisfaction.

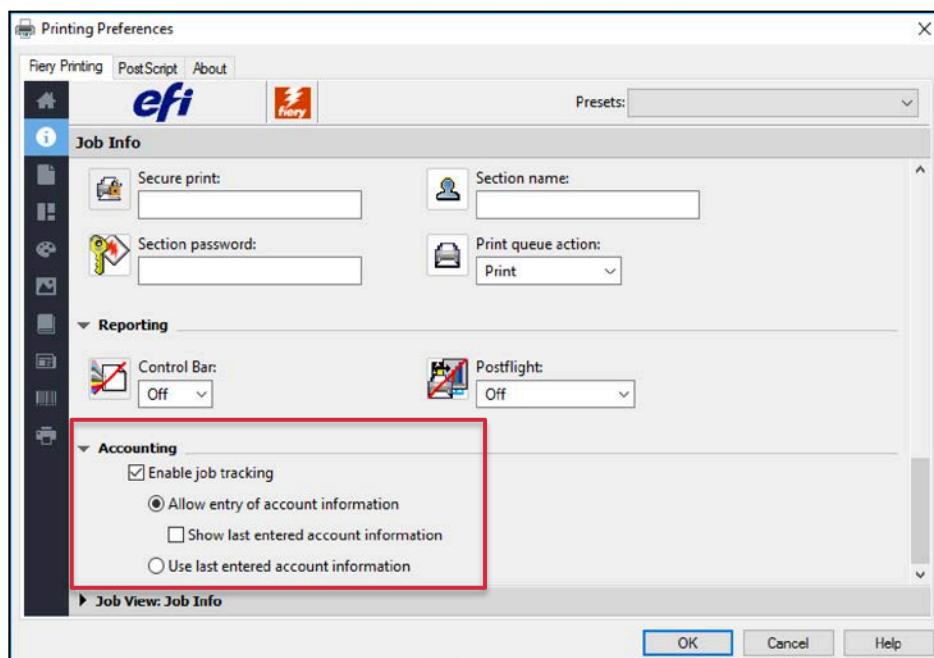

Equitrac integration with Fiery digital print servers requires the Fiery server to be properly configured. See tested Fiery servers and request configuration guides [here](#).

Job cost tracking

The Fiery driver includes the Job Cost Tracking feature, which configures the print driver to record the accounting information included in the print job. This means that print providers without a cost-accounting solution have a way to track print activity. The account code assigned is associated with a specific department or client project, and provides accurate printing costs that can be allocated back to the internal department or client project.

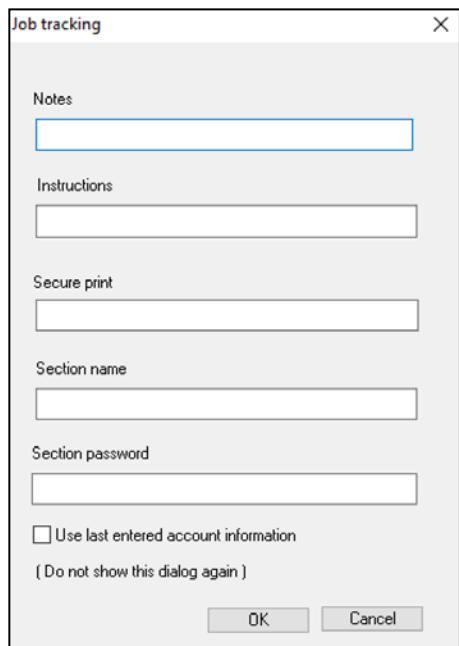

A pop-up dialog box comes up immediately after users click print, to remind them to enter the account information which is collected in the Fiery Job Log so that it can be retrieved and exported to other accounting systems.

The feature does not validate data entered in the pop-up dialog box. The print engine does any required validation.

Job Tracking setting in Fiery driver

Job Tracking account information required

Mobile printing

Direct Mobile Printing

All System10/10e Fiery servers and above provide Direct Mobile Printing for Apple iOS devices running version 4.2 and above. Wi-Fi-enabled Apple iOS devices will automatically discover any System10/10e and later Fiery Driven printer on the same network inside the corporate firewall. Users or IT administrators don't need to install any additional print drivers or software for the iOS devices. Visiting remote employees can print using their Apple iOS device without looking for a printer, installing print drivers, or requiring assistance from corporate support resources. Local employees can print while moving around to different departments, conference rooms, and other locations in the company on the same network.

Benefits:

Allows visiting remote employees with Apple iOS devices to easily print without any additional steps

Allows local employees with Apple iOS devices to change locations and easily print without any additional steps

Access to training and Fiery users worldwide

Learning@EFI on-demand learning platform

At EFI, we are committed to fueling your success.

[Learning@EFI](#) is the on-demand, 24/7 anytime, anywhere learning platform that helps you expand your staff's expertise on Fiery technology to take full advantage of your Fiery investment and make the most of your production capacity.

Whether you want to learn new skills or simply get credentialed for skills you already have, our learning options will enable you to learn the latest Fiery features and functionality to give you a competitive advantage.

Free training resources

Choose the EFI training resources that best fit your needs from a variety of self-paced web-based and simulation learning courses that make it easy to fit training into busy schedules.

- How-to guides: step-by-step instructions with sample files
- eLearning courses: interactive online learning sessions
- Express videos: short videos on key topics delivered by EFI subject-matter experts
- Simulation learning: learning solution that offers the opportunity to practice techniques and procedures in a realistic, immersive environment
- Podcasts: engaging audio shows on variety of topics
- Webinars: access to recordings of World of Fiery webinars, an on-going program of educational, and free webinars that feature valuable information for colour professionals and for owners and managers of print businesses and in-plant/CRD operations

Fiery certification programs

In today's fast-changing world, you need a convenient and affordable way to gain new skills and credentials quickly—so you can do more, be more, and take your career to the next level. Be a step ahead of the others. Our certification programs will help you stand out in your workplace or your business.

- Fiery Professional Certification

The Fiery Professional Certification teaches print professionals the necessary skills to optimise the performance of EFI technology solutions. Developed by EFI subject-matter experts, it provides the latest

Fiery FS400 / FS400 Pro print servers – Product guide

information on Fiery technology to develop employee skills, enhance professional development and transform print businesses.

- Fiery Expert Certification

The Fiery Expert Certification builds on the Fiery Professional Certification to develop more in-depth expertise. The expert courses help students master the advanced Fiery toolsets and learn to use the full range of features.

For more information on the Fiery certification programs and to enroll visit [this web page](#) on Learning@EFI.

EFI Communities

EFI launched a new customer engagement platform, EFI Communities at communities.efi.com where Fiery users have a place to find solutions, share ideas and discuss EFI products with our global community of experts.

Everything you can do in Fiery Forums, you can now do in EFI Communities. In fact, EFI Communities also offers additional great features:

A searchable knowledge base of technical articles created by the Fiery Technical Support team, for solutions to common or known issues

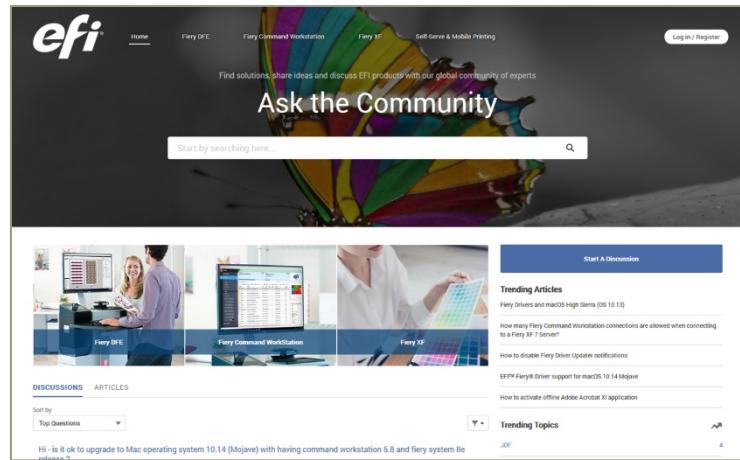

The ability to "follow" topics that interest you, or specific areas of focus

A personalised "feed" which is created dynamically based on your previous activities on the site

The ability to select the "best" answer from multiple provided solutions

New web design which is compatible with mobile devices

EFI Communities is currently available only in English.
