Powerful, accurate, roll stock inventory management

Advanced roll stock inventory solution for tracking every aspect of roll stock — from ordering to consumption.

Available as part of the complete EFI™ suite of manufacturing solutions — or as a standalone module — CorrTrac® helps corrugated manufacturers track every aspect of their roll stock inventory, from ordering to consumption, and the ability to monitor and manage paper costs throughout the accounting period.

CorrTrac’s automation and systems integration helps plants eliminate errors resulting from manual data entry, and increases roll stock inventory accuracy — ensuring that plant floor employees use the correct roll stock for a particular job. CorrTrac is user friendly — the simple user interface helps employees to quickly process large amounts of roll stock, and preserves the identity and attributes of each individual roll.

In plants that use CorrTrim® for trimming and scheduling their corrugator, CorrTrac can pass real-time roll availability information directly to CorrTrim, facilitating accurate and timely scheduling while improving trim results.

CorrTrac includes essential reporting features that provide plant management with detailed and actionable information on consumption history (by order, shift, or plant), roll history, and inventory — per grade, width, or state.

**Business benefits**

- Eliminates inventory errors
- Reduces downtime
- Reduces waste
- Provides visibility of roll stock from order to consumption
- Provides ability to trace rolls used on orders
- Manages butt roll inventory and tags easily
CorrTrac enables automated demand-driven roll stock replenishment to help reduce errors.

**Demand-driven replenishment**

CorrTrac enables automatic demand-driven roll stock replenishment to help reduce errors when ordering, and give better visibility into projected roll stock demand. CorrTrac’s Reorder Manager analyzes the number of rolls on hand, in transit, and historic roll stock consumption — and recommends the appropriate amount of rolls to order by grade and width. Planners can configure the Reorder Manager with minimum, maximum, and target inventory levels, and the software will use this information for roll stock analysis and order recommendations. Planners can include or exclude specific paper and width combinations from this analysis. CorrTrac can automatically transmit approved roll stock orders, or RFQ’s based on delivery date, directly to the mill via integration with CorrChain® — EFI’s supply chain execution software. In addition, CorrTrac can receive ASN’s and invoices electronically from the mill and send Electronic Fund Transfers (EFT) back to the mill via CorrChain. Depending upon the level of CorrChain integration at the mill, orders can appear directly in the mill’s own business system — and a delivery promise can be automatically transmitted back to the plant — reducing manual order entry.

**Clamp truck module**

Using the wireless module, you can install clamp truck screens and provide your drivers with roll stock inventory, tracking capability, and real-time corrugator lineup data. Your drivers will know exactly what time to deliver each roll to your corrugator in order to satisfy demand.

**Wet end module**

The wet end module records roll stock consumption and prints labels as the corrugator produces butt rolls. With CorrTrac you will have total traceability and will be able to reconcile which rolls ran against which orders, and at what times.
